### Figure 1 EPD Life Cycle Modules Cradle to Grave

#### **Data Sources**

Primary Data	Data was collected from primary sources 2019 to 2022 including the manufacturer and suppliers' standards, locations, logistics, technology, market share, management system in accordance with EN ISO 14044:2006, 4.3.2, [4]. All are biochemical-physical allocated none are economically allocated.
A1-A3 Stage inclusions	Operations include all known raw material acquisition, refining, processing plus scrap or material reuse from prior systems; electricity generated from all sources with extraction, refining & transport plus secondary fuel energy and recovery processes. Also, transport to factory gate; manufacture of inputs, ancillary material, product, packaging, maintenance, replacement plus flows leaving at end-of-waste boundary and fate of all flows at end of life.
Variability	Significant differences of average LCIA results are declared.
Chemicals of Concern	Contains no substances in the European Chemicals Agency "Authorised or Candidate Lists of Substances of Very High Concern (SVHCs)".

### **Data Quality**

Data cut-off & quality criteria complies with EN 15804 [1] The LCA used background data aged <10 years and quality parameters tabled below.

Background	Data Quality	Parameters and Uncertainty (U)								
Correlation	Metric σg	U ±0.01	U ±0.05	U ±0.10	U ±0.20					
Reliability	Reporting	Site Audit	Expert verify	Region	Sector

# Laminex

Formica Laminate-Velour

# **Product Information**

The Laminex Group is a leading manufacturer, distributor and marketer of decor board and surfaces.

Brand Name & Code	Formica Laminate-Velour 0.7mm
Range Names	Compact Laminate
Factory warranty	10 years use in interior residential and commercial kitchen wet areas
Manufacturer address	Laminex Industries 332 Bay Rd., Cheltenham VIC 3192 Australia
Site representation	Australasia
Geographical Area	Use and disposal as for Australasia
Application	Benchtops, Cabinetry & Wall Linings
Function in Building	Benchtop, Cabinetry & Wall Linings
Lifetime [5,6]	20 years Reference Service Life (RSL) [ISO 15686]
Declared unit	Formica Laminate 0.85kg/m <sup>2</sup> in wet areas of building interiors
Functional unit	20 years interior use of declared product/kg cradle to grave

#### **Product Components**

This section summarises factory components, functions, source nation and % mass share. In product content listed below the % mass has a  $\pm 5\%$  range and a confidence interval that is 90% certain to contain true population means at any time. Listing such  $90\pm 5\%$  certainty considers normal resource acquisition, supply chain, sedimentation, seasonal, manufacturing and product variation over this EPD's validity period. This also allows for intellectual property protection whilst ensuring fullest possible transparency.

Function	Component	Cradle	% w/w
Filler	Cellulose Fibre	Global	>64 <66
Binder	Phenol Formaldehyde	Germany	>22 <23
Binder	Melamine Formaldehyde	Germany	>6.0 <7.0
Other Agents	Fire retarder, plasticise, catalyst, biocide, wetting & release agents	Global	each <1.0
Packaging			
Crate	Timber	Australia	>3.0 <4.0
Pallet	Timber	Australia	>1.5 <2.0
Wrapping etc	Polymers	Global	>1.0 <1.5
Coverboards	Medium density fibreboard	Australia	>0.1 < 0.2
Straps & Tape	Polyester	Global	>0.05 < 0.10

#### **Product Functional & Technical Performance Information**

This section provides manufacturer specifications and additional information.

Specifications, Maintenance, Fire, Safety & Installation	https://www.laminex.com.au/trade
AS/NZS standard classification	Group 3
Panel dimensions length*width ±10mm	3.6*1.5m or 3.6*0.75m
VOC Specific Area Emission Rate	0.5mg/m²/hr

# System Analysis Scope and Boundaries

Stages A1 to 3 model actual operations. Stage A4 to C4 are model scenarios.

Typical scenarios are assumed to forecast unit operations as described in the next section.

Figure 2. shows included processes in a cradle to grave system boundary to end of life fates to unshown beyond the boundary reuse, recycling or landfill grave.

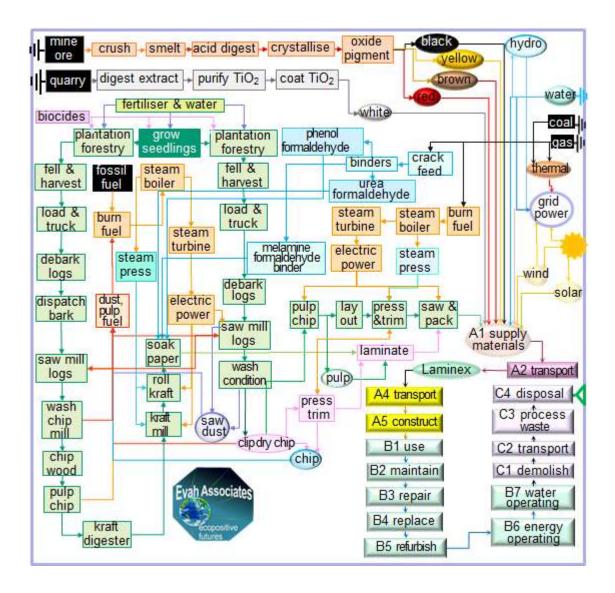

Figure 2. Product Process Flow Chart

# **Scenarios for Modules/Functional Unit**

Stages A1 to A3 model actual operations. This section defines scenarios A4 to D3. C3 Waste Treatment has no flows.

	Phase	Operation	Type specified	Amount	Type specified	Amount
		Transport to Site	25t semi-trailer	60 km	85% Capacity	Full back load
		Long distance road	25t semi-trailer	600km	85% Capacity	Full back load
٦	A4 Transport	Continental freight rail	Diesel train	600km	85% Capacity	Full back load
	Transport	Container shipping	Factory to CBD	1,200km	85% Capacity	Full back load
		Volume capacity (<1 ≥1)	Utilisation factor	1	Uncompressed	Un-nested
		Ancillaries	Adhesive	0.025kg	Edge trim	0.0001kg
		Packing	Cardboard	0.005kg	Polymer	0.00001kg
	A5	Water & Energy	Town water	0.5litre	Grid power	0.0002 MJ
		Waste on site	Trims	0.05kg	All packaging	As shown kg
		Scrap collection & route	25t semi-trailer	60 km	to landfill	In LCA report
		Emissions	Nil to air & water	0.0kg	All from landfill	In LCA report
		Maker's specification	URL Declared	Specified	Clean cycle	Weekly
	B2 Maintain	Ancillaries	Wipes	Negligible	Detergent	0.007kgpa
	Wantan	Surface Washdown	Town water	1.95kgpa	Net to drain	1.90kgpa
	50	Typical practice	Damaged parts	0.05kg	Worn parts	Same 5%
	B3	Maker's specification	As per website	Specified	Freight to site	As A5
	Repair	Energy input & source	No excess	0.0MJpa	Packaging	As A5
	C1	Typical practice	Remove worn	0.05kg	Collect Separate	0.05kg
	Demolish	Collection process	In site waste	0.40kg	Separate to reuse	0.0kg
	C2 Transport	Typical practice	25t truck road	50km	85% capacity	No back load
	C3 Waste Treatment	Typical practice	No waste treated	0.0kg	Not for energy	0.0kg
		Typical practice	Product specific	0.05kg	Collect separately	0.05kg
	C4 Dispose	Typical practice	Worn to landfill	5%	All emissions	mass share
	Diopooo	Recovery system	No recycling	0.0kg	Not for energy	0.0kg
	D1 Reuse	Typical practice	Reuse	95%	Patch 5%	0.05kg
	D2 Recover	Typical practice	Recover	100%	Cleaning	sweep
	D3 Recycle	None typically	At 60 years	Nil	None	0%

## **Environmental Impact Terminology**

The United Nations reports only a few decades are left to resolve accelerating climate emergency and extinction crises. It is a call to action to all people to reverse the loss of climate and biodiversity security from human development in all activity [16]. Key environmental damages contributing to risks of ecological and community loss and collapse are tabled below with common names and remedies for each indicator.

Climate change from anthropo- genic infrared forced global warming	Greenhouse gases absorb infra-red radiation. This heat reduces thermal energy differentials, from equator to poles, forcing ocean current and wind circulation to blend and regulate climate. Weakly blended "lumpier" weather has more frequent, extreme heat wave, fire-storm, cyclone, rain-storm, flood and blizzard events. Accumulation of carbon dioxide, natural gas methane, nitrous oxides and volatile organic compounds from burning fossil fuels causes global warming. Forest and wilderness growth absorbing air-borne carbon in biomass can drawdown such accumulation. Urgent renewable energy reliance is vital in time to avoid imminent tipping points and the worsening " <i>climate emergency</i> ".
Ozone layer depletion	Stratospheric ozone loss weakens the planet's solar shield so more shorter wavelength ultraviolet (UVB) light reaching earth damages plants and increases malignant melanoma and skin cancer in humans and animals. Chlorofluorocarbons, hydrochlorofluorocarbons (HCFC), hydrobromofluorocarbons, carbon tetrachloride, chlorobromomethane, methyl chloroform, methyl bromide and halon gas cause ozone layer loss. To repair the "ozone hole" reliance on ozone-safe refrigerants, aerosols and solvents is essential to avoid further its depletion and enable accumulation of naturally-formed ozone.
Acidification of air, land and waters	Acidification in the atmosphere reduces soil and waterway pH, impedes nitrogen fixation vital for plant growth and inhibits natural decomposition. It increases rates and incidence of fish kills, forest loss and deterioration of buildings and materials. Chief synthetic causes of " <i>acid rain</i> " are emissions of sulphur and nitrogen oxides, hydrochloric and hydrofluoric acids and ammonia from burning fossil fuels polluting precipitation of rain and snow world-wide.
Eutrophication of terrestrial, freshwater and marine life	Eutrophication from excessively high macronutrient levels added to natural waters promotes excessive plant growth that severely reduces oxygen, water and habitat security for aquatic and terrestrial organisms across related ecosystems. Chief synthetic cause of " <i>algal blooms</i> " is nitrogen (N, NOx, NH <sub>4</sub> ) and phosphorus (P, PO <sub>4</sub> <sup>3-</sup> ) in rain run-off over-fertilised land catchments.
Photochemical ozone creation	Tropospheric photochemical ozone, called " <i>summer smog</i> " near ground level, is created from natural and synthetic compounds in UV sunlight. Low concentration smog damages vegetation and crops. High concentration smog is hazardous to human health. Chief synthetic causes are nitrogen oxides, carbon monoxide and volatile organic compounds (VOC) pollutants. Avoiding reliance on dirtiest coal fuel and volatile chemicals has reduced smog incidence in many areas globally.
Depletion of minerals, metals & water	Abiotic depletion of finite mineral resources increases time, effort and money required to obtain more resources to the point of extinction of naturally viable reserves. This can limit access to available, valuable and scarce elements vital for human-life. The youth movement " <i>extinction rebellion</i> " calls on adults to secure climate, material reserves and biodiversity for current and future generations.
Depletion of fossil fuel reserves	Abiotic depletion of resources by consuming finite oil, natural gas, coal and yellowcake fossil fuel reserves leaves current and future generations suffering limited available, accessible, plentiful, essential valuable as well as scarce raw material, medicinal, chemical, feedstock and fuel stock. Approaching " <i>peak oil</i> " acknowledged fossil fuel reserves are finite and the need for decision-makers to act to avoid market instability, insecurity and or oil and gas wars.

#### Formica Laminate-Velour

## Interpretation Cradle to Gate A1 to A3

The first interpretation section discusses Compact High Pressure Laminate results cradle to gate A1 to A3. Their names are Formica Velour (FO), Natural Nuance Chalk (NNC), Absolute Matte (AM), Chemical Resistant (Lab), CustomArt® (CA) and Natural Nuance Chalk Impressions (IMP)

Figure 3 charts their component mass kg/kg product A1-3. Figure 4 charts energy and feedstock input (MJ), versus filler, binder and greenhouse emissions (GWP) (kg)/kg product A1-3.

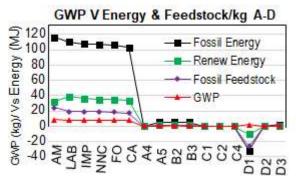

### Figure 3 Material Component Share kg/kg Figure 4 Input Share (MJ & kg) Vs CO<sub>2e</sub> kg/kg

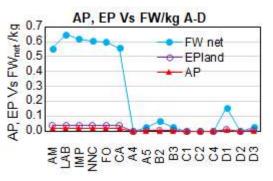

Figure 3 shows cellulose filler and binders of Phenol or Melamine Formaldehyde (PF or MF) were the main components with others having very low mass share. Figure 4 shows reliance on fossil energy then renewable energy use then fossil feedstock compared to reliance on cellulose fill and formaldehyde binders versus low GWP. Renewable cellulose feedstock fill and renewable energy use reduced GWP.

#### Interpretation Cradle to Grave and Beyond the System Boundary A1 to D3

The next section discusses product results cradle to fate A1 to C4 and to D3 beyond the system boundary/kg Functional Unit.

Figure 5 charts fossil and renewable energy use and fossil feedstock use versus GWP. Figure 6 charts Freshwater use (FW <sub>net</sub>) Vs Acidification (AP) and Terrestrial Eutrophication (EP <sub>land</sub>).

### Figure 5 GWP vs Energy & Feedstock A-D/kg

Figure 5 shows low GWP overall. It shows flows with minor credits in energy reuse beyond 20-years. Chart 6 shows Acidification and EP peak with cleaning in D1 reuse beyond 20-years.
