ArmstrongFlooring

Non-coated slip retardant flooring sheet Accolade® Safe, Infinity Safe

Product Information

Range Names	Non-coated slip-retardant flooring sheet
Based Massac	Accolade® Safe
Brand Names	Infinity Safe
Manufacturer	Armstrong Flooring Ltd
Factory warranty	10 years
Manufacturer address	29-39 Mills Road, Braeside Victoria 3195
Site representation	29-39 Mills Road, Braeside Victoria 3195
Application	Uncoated slip-retardant floor covering sheet
Function in Building	Slip-retardant flooring via surface embossing reducing aquaplaning
Specifications	Mineral filled polyvinyl chloride resilient flooring
Declared unit	1 kg = 0.34483m ² of non-coated slip-retardant floor covering
Functional unit	20 years use of declared 2.9 kg/m² Armstrong flooring per kilogram
Design Application	Dry areas of Hospital, Aged Care, Health Care, Education, Hospitality, Mercantile and Light Industrial sector buildings.
Practices Reference	https://www.armstrongflooring.com/pdbupimages-flr/223752.pdf
Installation Procedure	https://www.armstrongflooring.com/pdbupimages-flr/223751.pdf
Practicality	Embossed surface offers safe grip. Excellent dent and gouge resistance. Colour chips mask dirt.
Durability	Grip without silicon carbide attracted and held dirt, increased maintenance and wear rates of cleaning equipment. Embossed surface and High visibility colour chips mask dirt and wear marks in high use areas

Product Functional & Technical Performance

This section provides manufacturer specifications, additional information and datapoints required to calculate assessment results factoring different mass and periods.

Service	Standards	Parameters	Conformance to standards

Product Composiiton

This section summarises factory components, functions, source nation and % mass share. In the product content listed below the % mass has a $\pm 5\%$ range and a confidence interval that is 90% certain to contain true population means at any time. This allows for intellectual property protection whilst ensuring fullest possible transparency. Listing such 90 $\pm 5\%$ certainty also considers normal resource acquisition, supply chain, sedimentation, seasonal, manufacturing and product colour variation over this EPD's 5-year validity period.

System Analysis Scope and Boundaries

Stages A1 to 3 model actual operations. Stage A4 to C4 are model scenarios. Typical scenarios are assumed to model forecast unit operations as described in the next section. Figure 2. shows included processes in a cradle to grave system boundary to end of life fates beyond the boundary to unshown:

- reuse,
- recycling or
- landfill grave.

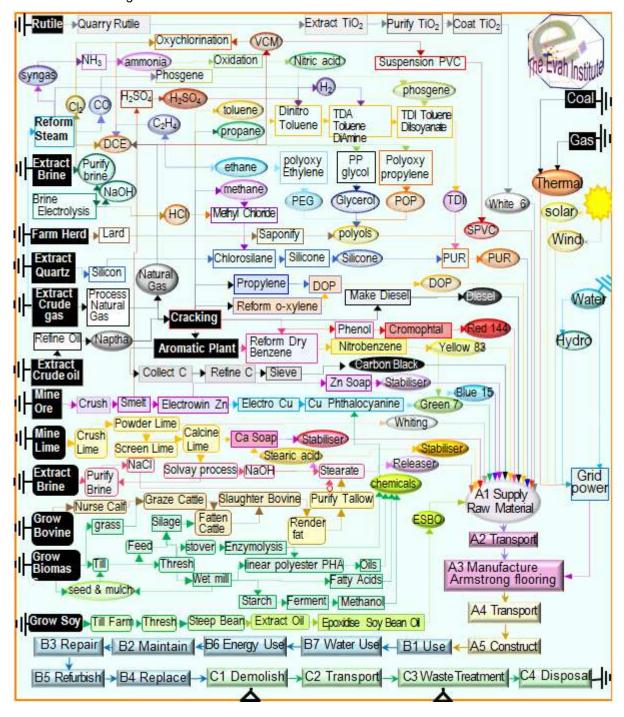

Figure 2. Product Process Flow Chart

ArmstrongFlooring*

Non-coated slip retardant flooring sheet Accolade® Safe, Infinity Safe

Scenarios for Modules

This section defines modelling scenarios. Stages A1 to A3 model actual operations. Stage A4 to D3 model scenarios described as listed below.

A Construction

A4 Transport to Site	Type specified	Amount	Type specified	Amount
Intercity road trucking	2t to 5t vans	220 km	85% Capacity	Full back load
Long distance road trucking	25t semi-trailer	600 km	85% Capacity	Full back load
Continental freight rail	Diesel train	600 km	85% Capacity	Full back load
Global container shipping	Factory to CBD	1,200km	85% Capacity	Full back load
Volume capacity (<1 to ≥1)	Utilisation factor	1	Uncompressed	Un-nested
A5 Installation: Ancillaries	Adhesive	0.025 kg	Edge trim	0.0001 kg
Packing	Cardboard	0.005 kg	Polymer	0.00001 kg
Water & Energy	Town water	0.00 m3	Energy type	0.0 MJ
Waste on site	Trims	0.05 kg	All packaging	As declared kg
Scrap, collection & routes	No recycling	0.0 kg	Energy recovery	0.0 kg
Emissions	Nil to air & water	0.0 kg	All from landfill	In LCA report

B Building

Stage B1 Use of building fabric has zero flows. Stage B2 and B3 scenarios are listed below. Stages B4 Replacement, B5 Refurbishment, B6 Building Operating Energy and B7 Building Operating Water each have zero flows

B2 Maintenance	Type specified	Amount	Type specified	Amount
Maker's specified process	URL declared	Specified	Clean cycle	Weekly
Ancillary material (kg)	Scrubber pads	Negligible	Detergent	0.007kgpa
Washing net water use	Town water	1.95kgpa	To drain 1.90	kgpa
Vacuum cleaning energy	Once weekly	1.62MJpa	Power mix	Local AU mean
B3 Repair	Damaged parts	0.05kg	Worn parts	Same 5%
Maker's specified process	As per website	Specified	Freight to site	As A5
Energy input & source	No excess	0.0MJpa	Packaging	As A5

Stage C1, C2 and C4 scenarios are listed below. Stage C3 Waste Treatment has zero flows.

C End Of Life

C1 Demolition	Type specified	Amount	Type specified	Amount
Operation	Take up worn	0.40kg	Collection	Separate
Collection process	In site waste	0.40kg	Separate to reuse	0.0kg
C2 Transport	25t truck road	50km	85% capacity	No back load
C4 Disposal	Product specific	0.40kg	Collect separately	0.40kg
Typical Scenario	high wear to	40%	All emissions	mass share
Recovery system	No recycling	0.0 kg	Not for energy	0.0 kg

Stage D1 scenario is listed below. Stages D2 Recovery and D3 Recycling have zero flows.

D Beyond System Boundary

D1 Reuse	Type specified	Amount	Type specified	Amount
Typical Scenario	Retain low wear	60%	Reuse in place	0.60kg

Non-coated slip retardant flooring sheet Accolade® Safe, Infinity Safe

Environmental Impact Terminology

Environmental impacts contributing to risks of social and ecological issues and collapse are tabled below with common names and remedies given for each indicator.

Global warming forcing Climate Change

Greenhouse gases absorb infra-red radiation. This heat reduces thermal energy differentials, from equator to poles, forcing ocean current and wind circulation to blend and regulate climate. Weakly blended "lumpier" weather has more frequent, extreme heat wave, fire-storm, cyclone, rain-storm, flood and blizzard events. Accumulation of carbon dioxide, natural gas methane, nitrous oxides and volatile organic compounds from burning fossil fuels causes global warming. Forest and wilderness growth absorbing air-borne carbon in biomass can drawdown such accumulation. Urgent renewable energy reliance is vital in time to avoid imminent tipping points and the worsening "climate emergency".

Ozone layer depletion

Stratospheric ozone loss weakens the planet's solar shield so more shorter wavelength ultraviolet (UVB) light reaching earth damages plants and increases malignant melanoma and skin cancer in humans and animals. Chlorofluorocarbons, hydrochlorofluorocarbons, hydrobromofluorocarbons, chlorobromomethane, carbon tetrachloride, methyl chloroform, methyl bromide and halon gas cause ozone layer loss. To repair the "ozone hole" reliance on ozone-safe refrigerants, aerosols and solvents is essential to avoid further its depletion and enable accumulation of naturally-formed ozone.

Acidification

Acidification reduces soil and waterway pH, impedes nitrogen fixation vital for plant growth and inhibits natural decomposition. It increases rates and incidence of fish kills, forest loss and deterioration of buildings and materials. Chief synthetic causes of "*acid rain*" are emissions of sulphur and nitrogen oxides, hydrochloric and hydrofluoric acids and ammonia from burning <u>fossil fuels</u> polluting rain and snow precipitation world-wide.

Eutrophication of terrestrial, freshwater and marine life

Eutrophication from excessively high macronutrient levels added to natural waters promotes excessive plant growth that severely reduces oxygen, water and habitat security for aquatic and terrestrial organisms across related ecosystems. Chief synthetic cause of "*algal blooms*" is nitrogen (N, NOx, NH₄) and phosphorus (P, PO₄³⁻) in rain run-off over-fertilised land catchments.

Photochemical ozone creation

Tropospheric photochemical ozone, called "summer smog" near ground level, is created from natural and synthetic compounds in UV sunlight. Low concentration smog damages vegetation and crops. High concentration smog is hazardous to human health. Chief synthetic causes are nitrogen oxides, carbon monoxide and volatile organic compounds (VOC) pollutants. Avoiding reliance on dirtiest coal fuel and volatile chemicals has reduced smog incidence in many areas globally.

Depletion of water, metals & minerals

Abiotic depletion of finite mineral resources increases time, effort and money required to obtain more resources to the point of extinction of naturally viable reserves. This can limit access to available, valuable and scarce elements vital for human-life. The youth movement "extinction rebellion" calls on adults to secure climate, reserves and biodiversity for current and future generations.

Depletion of fossil fuel reserves

Abiotic depletion of resources by consuming finite oil, natural gas, coal and yellowcake fossil fuel reserves leaves current and future generations suffering limited available, accessible, plentiful, essential valuable as well as scarce raw material, medicinal, chemical, feedstock and fuel stock. Approaching "peak oil" acknowledged fossil fuel reserves are finite and the need for decision-makers to act to avoid market instability, insecurity and or oil and gas wars.

Glossary of Terms and Units

Impact Potentials, acronyms, methods and units are defined below.

Impact Potentials	Acronym	Description of Methods	Units
Climate Change total	GWP	Global Warming Potential [7]	
Climate Change fossil	GWP ff	GWP fossil fuels [7]	
Climate Change biogenic	GWP bio	GWP biogenic [7]	kg CO _{2eq} .
Climate Change land use	GWP luluc	GWP land use & change [7]	
Stratospheric Ozone Depletion	ODP	Stratospheric Ozone Loss [8]	kg CFC _{11eq}
Photochemical Ozone Creation	POCP	Summer Smog [9]	kg NMOC eq
Acidification Potential	AP	Accumulated Exceedance [10]	mol H ⁺ eq
Eutrophication Freshwater	EP fresh	Excess nutrients freshwater [11]	kg P _{eq}
Eutrophication Marine	EP marine	Excess marine nutrients	kg N _{eq}
Eutrophication Terrestrial	EP land	Excess Terrestrial nutrients	mol N eq
Mineral & Metal Depletion	ADP min	Abiotic Depletion minerals [12]	kg Sb eq
Fossil Fuel Depletion	ADP fossil	Abiotic Depletion fossil fuel [13]	MJ_{ncv}
Water Depletion	WDP	Water Deprivation Scarcity [14, 15]	$m^3 {\text{WDP eq}}$

Inventory inputs, acronyms, methods and units are defined below.

Input flows	Acronym	Description of Methods	Units
Fresh Water Net	FW	Lake, river, well & town water	m^3
Secondary Material	SM	Post-consumer recycled (PCR)	kg
Renewable Secondary Fuel	RSF	PCR biomass burnt	MJ_{ncv}
Primary Renewable Material	PERM	Biomass retained material	MJ_{ncv}
PER Excluding Feedstock	PERE	biomass fuels burnt	MJ_{ncv}
Primary Energy Renewable Total	PERT	Biomass burnt + retained	MJ_{ncv}
Unrenewable Secondary Fuel	NRSF	PCR fossil-fuels burnt	MJ_{ncv}
PE Finite Energy not Feedstock	PENRE	fossil-fuel used or burnt	MJ_{ncv}
PE Unrenewable Material	PENRM	Fossil feedstock retained	MJ_{ncv}
Primary Energy Unrenewable Total	PENRT	Fossil feedstock & fuel use	MJ_{ncv}

Outputs, acronyms, methods and units are defined below.

Inventory Output flows	Acronym	Description of Methods	Units
Hazardous Waste Disposed	HWD	Processed to contain hazard risks	kg
Non-hazardous Waste Disposed	NHWD	Municipal landfill facility waste	kg
Radioactive Waste Disposed	RWD	Mostly nuclear power station waste	kg
Components For Reuse	CRU	Production scrap for reuse as is	kg
Material For Recycling	MFR	Production scrap for remanufacture	kg
Material For Energy Recovery	MER	Production scrap for use as fuel	kg
Exported Energy Electrical	EEE	Common for buildings not products	MJ_{ncv}
Exported Energy Thermal	EET	Common for buildings not products	MJ_{ncv}

Module D Results Beyond System Boundaries

Table 4 shows Module D Beyond system boundaries D1 Reuse stage credits products results /functional unit as negatives as they reduce the impacts over the building life. All flows and results were zero for D1 Exported Energy Electrical (EEE) and Thermal (EET) as well as D2 Recovery and D3 Recycling.

Table 4 D1 Reuse Results /Functional Unit

Interpretation

This section interprets overall results. Table 5 lists component mass % share versus Global Warming Potential (GWP kg CO_{2e}) and % share gross embodied energy (EE) results/kg products cradle to gate A1 to A3.

Figure 3 charts mass % results versus gross %EE share/kg A1 to A3. Results show highest sensitivity to PVC binder content and least sensitivity to limestone (CaCO₃) filler content.

Figure 4 charts GWP results versus Abiotic Depletion of Fossil Fuel/kg A1 to A3. Results show most GWP emissions from PVC binder, electricity usage and DOTP plasticiser.

Table 5 Component & EE% Vs GWP/kg Component Mass% EE% **GWP PVC** <45 39.9 1.11 DOTP <15 12.9 0.26 rPVC <1.0 0.20 0.09 0.07 Soap <3.0 1.91 **ESBO** 0.06 <1.0 1.48 TiO₂ < 2.0 0.93 0.04 pigment < 0.5 0.12 0.02 **PUR** < 0.5 0.30 0.01 **DPOP** < 0.5 0.27 0.01 CaCO₃ <45 0.00 0.66

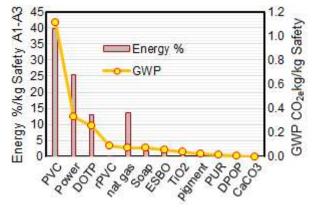

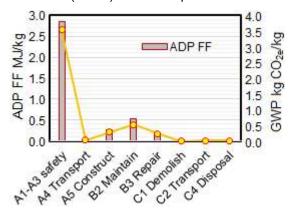

Figure 3 Component Vs EE % share//kg A1-A3

Figure 4 GWP Vs ADP FF/kg A1-A3

Figure 5 charts A1 to C4 GWP results versus ADP FF /kg product. Figure 6 charts A1 to C4 Photochemical Smog (POCP), Acidification (Ap), Marine Eutrophication (Ep M) and GWP results/kg product. Both charts show A1 to A3 product manufacture highest results and B2 maintenance (cleaning) second highest. A3 Construct (Install) and B3 Repair are third but other stages have no significance.

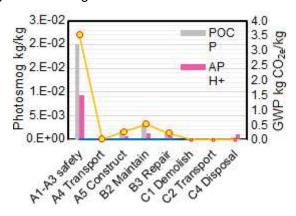

Figure 5 GWP Vs ADP FF /kg A1-C4

Figure 6 GWP, POCP, AP & EP M/kg A1-C4

Module D Beyond System Boundary results show typical D1 Reuse of 60% of least-worn product in low traffic bedroom, office and storage areas for 40 more years reduces all impacts >40%/kg for a 60-year building life with the same new product to 40% of the floor area in high traffic areas. Results for phases A4 to C4 are significant and these remain unchanged for replacement flooring over the building life.
