**EPD Verification and LCA detail**

Range Name	Autex Acoustics® Panels	Product Name	Embrace Wool Felt
------------	-------------------------	--------------	-------------------

**Demonstration of Verification**

<b>Objectives</b>	To show improved, net-zero, net-positive and regenerative results and timely imperatives to secure viable climate and biodiversity on earth against a background of increasing disasters attributable to anthropogenic climate change.
<b>Communication</b>	This EPD discloses potential environmental outcomes compliant with ISO14025:2010 for business-to-business communication. Independent external verification of this declaration and data ensures fitness for business-to-consumer communication [1].
<b>Comparability</b>	Different program EPDs may not be comparable. Comparability is further dependent on the product category rules and data source used.
<b>Reliability</b>	Life Cycle Impact Assessment (LCIA) results are relative expressions that do not predict impacts on category endpoints, exceeded thresholds, safety margins or risks.

LCA & EPD Peer Review by Dr Sharmina Begum, The Evah Institute

EPD Platform Operator Review by David Baggs, Global GreenTag Pty Ltd

☒ **External**

I, the undersigned, 3<sup>rd</sup> party verifier, hereby confirm my examination did not find any relevant deviations by the EDP owner, LCA report or PCRs based on EN 15804 2012+A2:2019 and ECO Platform agreed interpretations by CEN TR 16970. Company-specific, upstream and downstream data in the LCA & environmental features report files held at The Evah Institute were plausible and consistent. This verification applied Global GreenTag International adopted ECO Platform checklists and this EPD states where to find PCRs and programme rules.

## Program Description

EPD Scope	The scope is cradle to grave A1 to C4 + D as defined by ISO14025. [1]																		
System boundary	The system boundary with nature includes material & energy acquisition, processing, manufacture, transport, installation, use plus waste out to end of life.																		
Stages included	All known operations and stages in modules A1 to D3 are included.																		
Information	Figure 1 depicts A1 to C4 modules inside this cradle to grave system boundary.																		
Model	Building Life Cycle Assessment																Beyond system		
Information	Actual				Scenarios														
Stages	Product			Construct		Use							End-of-Life				Benefit & load		
Modules	A1	A2	A3	A4	A5	B1	B2	B3	B4	B5	B6	B7	C1	C2	C3	C4	D1	D2	D3

## Primary Data Sources and Quality

<b>Primary Data</b>	Data was collected in accordance with EN ISO 14044:2006, 4.3.2, from primary sources including manufacturers, suppliers and their publications on standards locations, logistics, technology, market share, management system and commitment to improved environmental performance.
<b>Cut-off &amp; Data quality</b>	Criteria complies with EN 15804:2012+A2:2019.
<b>Allocation</b>	Physical by mass and/or energy flow share and not by economic share.
<b>Range and variability</b>	Significant differences of mean LCIA results are declared.

## Data Sources

<b>Primary Data</b>	Primary data is from primary sources 2023 to 2025 including manufacturer and supplier standards, logistics, technology, market share and management system in accordance with EN ISO 14044:2006, 4.3.2. All are physically allocated and none economically.
<b>A1-A3 Stage inclusions</b>	<p>Operations include all</p> <ul style="list-style-type: none"> <li>known raw material acquisition, refining and processing plus</li> <li>scrap or material reuse from prior systems;</li> <li>electricity generated from all sources with extraction, refining &amp; transport plus</li> <li>secondary fuel energy and recovery processes. Also</li> <li>transport to factory gate;</li> <li>manufacture of inputs, ancillaries, products, packaging, maintenance, replacement</li> <li>plus flows leaving at end-of-waste boundary and</li> <li>fate of all flows at end of life.</li> </ul>
<b>Variability</b>	Significant differences of average LCIA results are declared.
<b>Chemicals of Concern</b>	Contains no substances in the European Chemicals Agency "Authorised or Candidate Lists of Substances of Very High Concern (SVHCs)".

## Product Information

This section provides data required to calculate assessment results factoring different mass and periods.

<b>Manufacturing Site</b>	702-718 Rosebank Road, Avondale, Auckland, New Zealand
<b>Range Names</b>	Autex Acoustics® Panels
<b>Brand Name &amp; Code</b>	Embrace Wool Felt
<b>Time</b>	Made and sold in 2025 for first use
<b>Factory warranty</b>	10 years
<b>Site Representation and Geography</b>	New Zealand, Australasia, Pacific Rim and the World
<b>Functional Performance in Building</b>	Reduce and control reverberated noise and echo in building interiors. create high-performance acoustic features for interior space.
<b>Reference Service Life</b>	RSL 20 years with 97% reuse. Higher churn must factor results B4 & B5.
<b>Declared Unit</b>	Wool Felt of given kg/m <sup>2</sup> coverage and noise reduction coefficient NRC <sup>1</sup>
<b>Functional Unit</b>	20 year use per kg declared >0.2NRC product of given kg/m <sup>2</sup> coverage.

## Product Components Base Material Origin and Detail

This section summarises factory components, functions, source nation and % mass share. Key components by function, type, sources and % mass share are tabled below.

Function	Component	Source	Amount
<b>Substrate</b>	Knitted felted sheep wool	New Zealand	>99<100
<b>Process additives</b>	Dyes & conditioners	Global	<0.1%

## Product Functional & Technical Performance Information

This section provides manufacturer specifications and additional information.

<b>Applicable standards</b>	Sound absorption performance complies as determined using ISO 354 methodology. Reaction to fire performance complies with ISO 9705:1993, AS 5637.1:2015, BS EN 13501-1 and ASTM E84.
<b>Length*Width</b>	(25,000*1,600) mm
<b>Acoustic Properties</b>	0.45-0.70 NRC
<b>Coverage</b>	1000 gsm

<sup>1</sup> NRC = Noise reduction coefficient conforming to ISO11654 standard methods

### System Scope and Boundaries

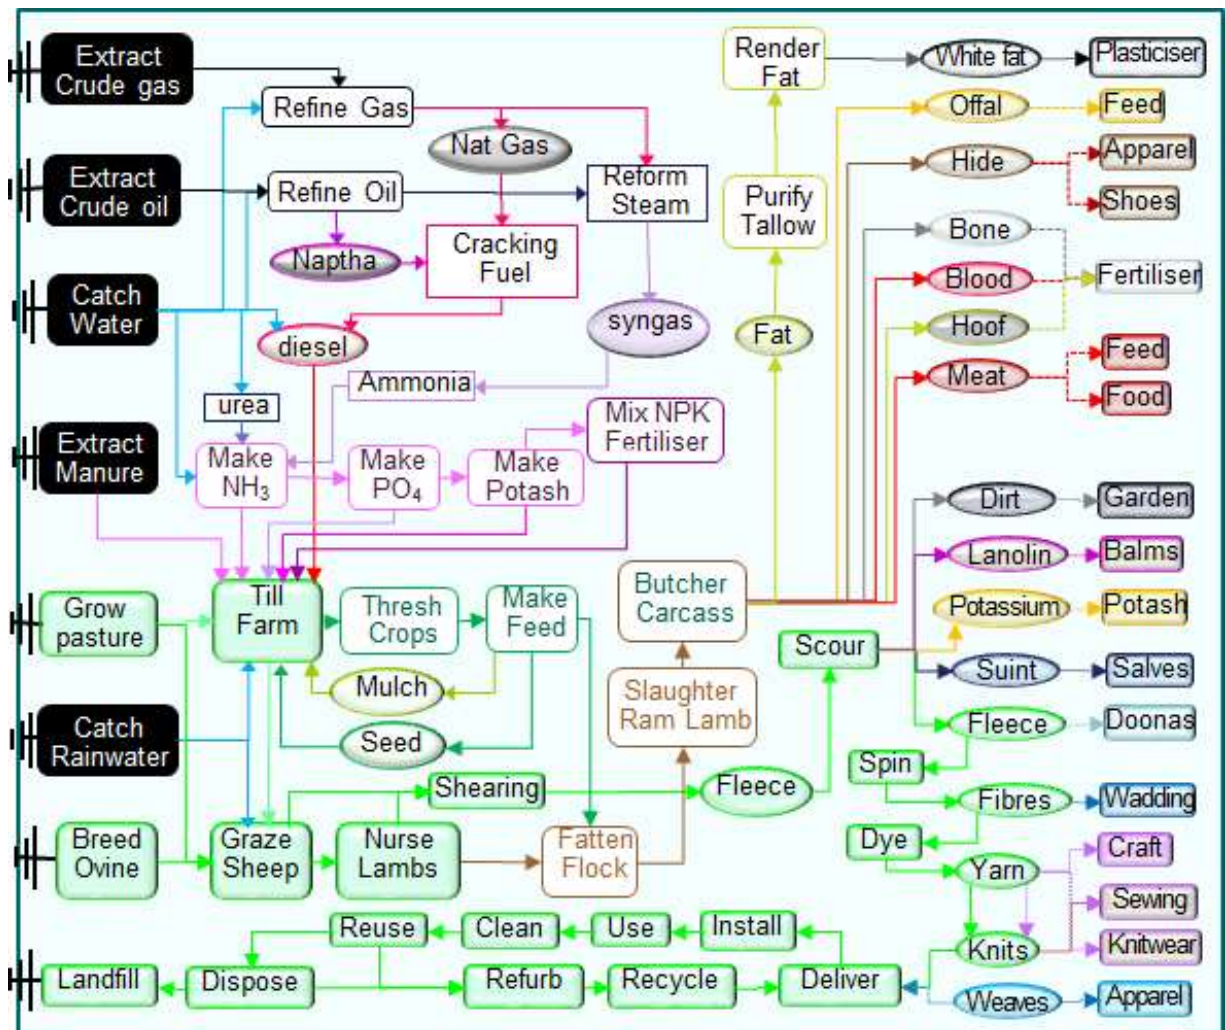

Figure 2 shows included processes in a cradle to grave system boundary to end of life fates reuse, recycling, or landfill grave.

Stages A1 to 3 model actual operations to acquire, refine, transport, fabricate, coat, use, clean, repair, reuse and dispose of metal, masonry, ceramic, timber, glass, plastic and composites.

Stage A4 to C4 are modelled on typical scenarios to forecast operations including those of:

- Mining, extracting and refining resources to make commodities and packaging;
- Acquiring, cultivating, harvesting, extracting, refining produce and biomass;
- Fuel production to supply power and process energy and freight;
- Chemicals use in processing resources, intermediates and ancillaries;
- Process energy, fuel and freight of resources, intermediates and ancillaries;
- Use, cleaning, recoating, repair, recycling, re-use and landfill, as well as
- Infrastructure process energy transformed and material wear loss e.g. tyres.

•

**Figure 2. Product Process Flow Chart**

### Scenario Descriptions

This section defines modelling stages scenarios A4 to D3 beyond actual operations in module A1 to A3.

Module	Type specified	Amount	Type specified	Amount
<b>Construction Modules</b>				
<b>A4 Transport factory to depot then to site</b>	Sea Shipping	13,000	85% Capacity	Full back load
	Interstate Rail	1300 km	85% Capacity	Full back load
	25t semi-trailer	200 km	85% Capacity	No back load
<b>A5 Install</b>	VOCs indoors	0%	Packaging & Waste	0%
<b>Building Modules</b>				
<b>B1 Use</b>	VOCs	0%	No other flows	0%
<b>B2 Maintain</b>	fit for purpose	0%	fit for purpose	100%
<b>B3 Repair</b>	fit for purpose	95%	Repair damaged	5%
<b>B4 Replace</b>	fit for purpose	0%	No other flows	0%
<b>B5 Refurbish</b>	fit for purpose	0%	fit for purpose	100%
<b>B6 Energy use</b>	off grid	0%	Solar and wind energy	100%
<b>B7 Water use</b>	off grid	0%	Rain and dew	100%
<b>End of Life Modules</b>				
<b>C1 Demolish</b>	Fit for purpose	0%	No other flows	0%
<b>C2 Transport</b>	Fit for purpose	0%	No other flows	0%
<b>C3 Waste Processing</b>	Fit for disposal	0%	No other flows	0%
<b>C4 Disposal</b>	Fit for purpose	0%	No other flows	0%
<b>Beyond System Boundary Modules</b>				
<b>D1 Reuse</b>	Fit for purpose	95%	No other flows	0%
<b>D2 Recover</b>	Fit for purpose	2%	No other flows	0%
<b>D3 Recycle</b>	Fit for purpose	3%	No other flows	0%

### Whole of life Performance

<b>Waste</b>	Cradle to grave waste to landfill from operations was non-hazardous.
<b>Disposal</b>	No production waste is sent to river, land or ocean outfalls or council landfills.
<b>Effluent</b>	LCI results and ESCAP raised no red-light concerns in emissions to water <sup>2</sup> .
<b>Wildlife safety</b>	Low VOC, no plastics, glues or formaldehydes.
<b>No Chemicals of Very High Concern</b>	Contains no substances in the “Authorised or Candidate Lists of Substances of Very High Concern (SVHCs)” with the European Chemicals Agency.
<b>Health Protection</b>	The product does not contain levels of carcinogenic, toxic or hazardous substances that warrant ecological or human health concern cradle to grave. No issues or red-light concerns existed for product human or ecological toxicity.
<b>Environmental Protection</b>	Continuous improvement under the maker's uncertified management system avoids toxics, waste and pollution plus reduce their material and energy use.
<b>Environmental Health Effects</b>	No potential in-use impacts on environment or health are known.
<b>Health Safety &amp; Environment</b>	Apart from compliance to occupational and workplace health safety and environmental laws no additional personal protection is considered essential for manufacture, use or reuse.

### LCA Primary Data Quality

Data was <10 years and quality parameters are tabled below. Cut-off & quality is ISO14025 compliant<sup>[1]</sup>.

**Table a LCA Primary Data Quality Parametrs and Uncertainty**

Background	Data Quality	Parameters and Uncertainty (U)			
<b>Correlation</b>	<b>Metric σg</b>	U ±0.01	U ±0.05	U ±0.10	U ±0.20
<b>Reliability</b>	<b>Reporting</b>	Site Audit	Expert verify	Region	Sector
	<b>Sample</b>	>66% trend	>25% trend	>10% batch	>5% batch
<b>Completion</b>	<b>Including</b>	>50%	>25%	>10%	>5%
	<b>Cut-off</b>	0.01%w/w	0.05%w/w	0.1%w/w	0.5%w/w
<b>Temporal</b>	<b>Data Age</b>	<3 years	≤5 years	<7.5 years	<10 years
	<b>Duration</b>	>3 years	<3 years	<2 years	1 year
<b>Technology</b>	<b>Typology</b>	Actual	Comparable	In Class	Convention
<b>Geography</b>	<b>Focus</b>	Process	Line	Plant	Corporate

	<b>Jurisdiction</b>	Representation is Global, Australasia and Pacific Rim			

<sup>2</sup> According with national standards in ANZECC Guideline For Fresh & Marine Water Quality (2000)

## Background Data Type and Sensitivity

### Sheep Wool Composition

Apart from Keratin protein greasy wool fleece contains 26% soil, 28% suint 12% fat and 1% water and trace minerals<sup>3</sup>. Removing soil, suint and fat leaves clean dry wool comprising 97% protein mass<sup>4</sup>. Table 1 lists strong wool chemical analysis results from literature reviews and industry research. Where analysis could not detect hydrogen, its content was calculated stoichiometrically. Overall averages show 46% Hydrogen 27% Carbon, 15% Oxygen, 9% Nitrogen and 3% Sulphur. Hydrogen content is highest followed by Carbon then less Oxygen, much less Nitrogen and least Sulphur. The high Hydrogen and Carbon reflects abundant input sources and low Oxygen reflects limited availability in rumen<sup>5</sup> compared to that in fodder.

**Table 1 Chemical Analysis Results ex Woolworks NZ<sup>6</sup> & CSIRO**

Sample No.	Source	Hydrogen	Carbon	Oxygen	Nitrogen	Sulphur	Total
>30	Literature	45	30	14	10	2	101
>8	ICP MS <sup>7</sup>	45	30	13	10	3	101
>8	SEM XD <sup>8</sup>	44	22	21	9	3	99
>16	Methionine <sup>9 10</sup>	45	27	14	7	7	100
>50	Polyamide	44	24	16	13	3	100
>16	Wool Protein <sup>11</sup>	51	27	13	7	2	100
>128	Mean	46	27	15	9	3	100

### Durable Sheep Wool Coproducts

Since 2009, the Evah Institute has developed LCIA for cattle tallow, sheep wool and goat cashmere products. Other ruminant products include emollients, fats, foods, feeds, fibres, fertiliser, hides, nutrients, leathers, oils, and waxes. Table 2 lists many sheep coproducts. Durable applications within sheep industry supply scope include insulation, upholstery, carpets, and plasticisers as listed.

**Table 2 Sheep Industry Coproducts**

Hide	Wool	Lanolin	Fats	Carcass	Intestines
Leathers	Yarns	Pharmaceuticals	Tallow	Meats	Sausage Casings
Upholstery	Fabric & Felt	Lotions	Polymers	Bone	Instrument Strings
Luggage	Carpet	Motor Oils	Plasticisers	Offal	Surgical Sutures
Footwear	Upholstery	Lubricants	Surfactants	Protein	Racquet Strings
Nursery Rugs	Doona Fill	Printing Ink	Industry Soap	Manures	Organs
Drum head	Matress Fill	Adhesive Tape	Chemicals	Potash	Meat & bone meal
Chamois	Clothing	Shampoo	Fatty Acids	Phosphorus	Blood meal
Sports gear	Knitwear	Conditioner	Solvents	N Fertiiser	Pet food
Baseballs	Coats & Hats	Cosmetics	Paints	Minerals	Blood
Tennis Balls	Socks & Mitts	Lipstick	Chewing Gum	Nutrients	Cultures
Oil Spill Pad	Art Brushes	Mascara	Explosives	Ash	Bacteria

Table 3 lists NZ upland Merino Perrindale sheep coproduct average allocated wet mass from site as well as industry data<sup>12</sup>. While wool has a 7.7% mass share of total coproduct, this ignores its insulation value reducing energy demand of flocks grazing in the open across exposed uplands in cold wet weather.

<sup>12</sup> Australasian Livestock coproduct mass share data reported in 2024 by <https://www.mla.com.au/>

**Table 3 NZ Upland Herd Strong Greasy Wool Fleece Coproduct Mass %Share**

Coproduct	Carcass	Meal: organs, blood,	Hide	Fleece	Tallow	Wet Gut	Sum
Mass %	50	22	13	7.7	6.7	0.6	100

### Sheep Fleece Greenhouse Gas (GHG) Emissions to 100 year Horizons

This section describes Greenhouse Gas (GHG) estimation cited in recent literature [4 to 9]. Figure 3 shows GHG ranging (8 to 58) kg CO<sub>2e</sub>/kg and a red line depicting the average 22kg CO<sub>2e</sub>/kg fleece.

**Figure 3 Recently Cited Assumed Wool Fleece GWP**

Table 4 cites such GHG results from a wide range of nations and climate. All were allocated on 22% to 50% share of the total. Being >3 to 6 times higher than 7.7% mass share means they do not reflect mass allocations in Table 3. Such LCA excluding significant coproduct shares does not comply with EN15804 standard for building product EPDs.

**Table 4 Recently Cited Wool Fleece Allocations by Protein.**

Country	First Author	Year	Code	Share %	kg CO <sub>2e</sub> /kg
New Zealand	Wiedemann	2015	NZ 2015	43	25.3
Australia		2015	AU 2015	45 and 50	32.0 and 24.7 respectively
		2016	AU 2016	35 and 38	25.0 and 21.7 respectively
				40 and 42	19.5 and 21.3 respectively
			47	20.1 and 20.0	
Australia	Cottle	2016	AU 2016	36	20.7
USA	Wiedemann	2018	USA 2018	22	38.4
Argentina	Peri	2020	ARG 2020	33	7.8, 8.8, 11.5, 12.4, 12.4, 13.3, 13.7, 14.7, 15.1, 16.9
New Zealand	Mazzetti	2023	Uncharted	31	22.2

The Mazzetto et al LCA report in 2023 for Wool Impact New Zealand (NZ) also finds 22kg CO<sub>2e</sub> 100kg fleece<sup>13</sup>. It did so after allocating 31% burdens to sheep wool and 69% to the hot carcass on protein content. Clean dry wool contains 97% protein whereas hot carcass wet meat contains only 25% protein by mass. It is assumed, that the authors factored in such differences.

### NZ Average Herd Total GWP versus Wool Shares

Table 5 reports GHG emissions allocated to the whole animal versus across those 2 products. It compares these to Evah biophysically allocated LCA to all coproducts including embodied carbon from comparable herds grazing on marginal upland in New Zealand. Note that Evah reduced the 7.7% mass fleece share to 5.7%

<sup>13</sup> Mazzetto A, Falconer S. & Ledgard S. (2023) Carbon footprint of strong wool from an average New Zealand sheep farm system, Confidential Report for Wool Impact RE450/2023/038

based on its insulation reducing energy demand and heat loss 25% annually in cold wet weather.

**Table 5 NZ Upland Herd Strong Greasy Wool Fleece GWP Mazzetto Vs Evah**

Allocated kg CO <sub>2e</sub> /kg % share	100% Live Animal	31% Mazzetto <sup>14</sup>	5.7%Evah
Enteric	59.55	18.46	3.407
Excreta	5.839	1.810	0.334
Fertiliser	3.548	1.100	0.203
Crops	0.839	0.260	0.048
Fuel	0.935	0.290	0.054
Lime	0.645	0.200	0.037
Pasture renewal	0.258	0.080	0.015
Pesticide	0.065	0.020	0.004

Herbicide	0.032	0.010	0.002
Rumen drawdown	0	0	-9.90
Pasture sequestration	0	0	-2.03
Soil drawdown	0	0	-0.018
Sub-total	72	22	-7.8

#### EN15804 Compliance Sheep Product LCA

All such cited studies also exclude all sequestration and embodied chemical drawdown [4 to 9]. On short-term single-use food, medicine, and packaging products LCA practice often ignores embodied input. History has shown, however, it is better to consider than ignore embodied content that can have cumulative effects.

Again, LCA excluding significant embodied GHG fails to comply with the EN15804 standard for building product EPDs. No durable wood, wool, polymer, ceramic, metal, or mineral merits its embodied content being ignored. Their quantification can reveal short term risks and enduring opportunities arising for:

- Mitigating human, environmental and climate health and resource depletion via.
  - landfill emissions retrieval for climate security and to reform feedstock for economic return.
  - material reuse, recovery, recycling and upcycling for economic returns on investment
  - feedstock energy recovery and reuse for fuel value and to reduce fire loads
  - feedstock energy recovery to avoid contaminating waterways, air and land
- Resource recovery via sewer mining sources of
  - biosolids via composting to avoid human disease, marine pollution and food chains
  - prescription drugs via biodigestors to avoid contamination marine food chains
  - hormones via bio digestors to avoid polluting marine food chains
  - secondary biomethane sources to fuel industry and urban greener technologies
  - hydrogen sources to fuel industry and urban climate-safe technology
  - energy to pump distilled water for urban reuse to avoid more sea level rise
  - energy to pump distilled water to industry and agriculture for economic security
  - biomass for making polymers, fertilisers and soil enriching bio char carbon.
  - scarce materials and tramp elements for making electronic components.

#### Wool Protein Chemical Compositions

Merino cross breed wool protein comprises amino acids molecular formulae and mass share listed in Table 6. In the last column each amino acid's microstructure depicted has the same basic structure of attached  $\alpha$ -carbon, hydrogen,  $\alpha$ -carboxyl,  $\alpha$ -amine and multivariate R-groups. Hydrocarbon **C-C-H**, methyl **CH<sub>3</sub>** and methylene **CH<sub>2</sub>** groups are shown in red, carboxyl **C=O** in blue, amines **N-H** and ammonias **N-H<sub>3</sub>** in green, sulphides **S** in yellow and unknown **R** groups in black.

<sup>14</sup> Mazzetto et al op cit

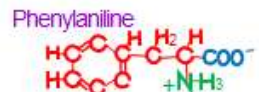

All 18 contain methyl and methylene groups but only methionine and cystine contain Sulphur.

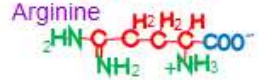

**Table 6 Chemical Microstructure Low GWP Wool protein CO<sub>2</sub>, CH and CH<sub>3</sub> mass share**

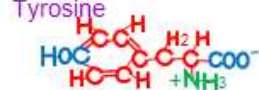

Protein	1 Mole	Chemical	Molecules		
Amino Acids	fraction	Formula	CO <sub>2</sub>	CH	CH <sub>3</sub>

### Chemical Microstructures of Wool Polyamide, Methionine versus Protein

This section compares typical clean sheep wool depictions of atom and compound types from generic polyamide to specifically known amino acids. Figure 4 depicts wool polyamide n(C<sub>2</sub>H<sub>4</sub>O<sub>2</sub>N<sub>x</sub>S<sub>2</sub>R<sub>y</sub>) with unknown side chains. Figure 5 depicts the methionine n(C<sub>5</sub>H<sub>11</sub>O<sub>2</sub>NS) that apart from methyl and methylene groups one of only two amino acid sources of Sulphur vital to maximise merino wool growth<sup>15</sup>.

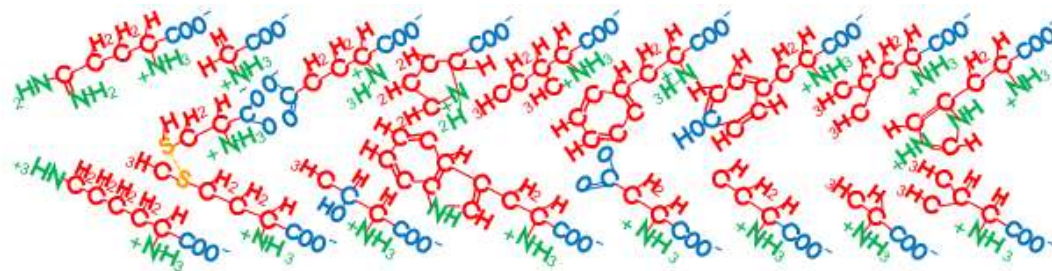

**Figure 4 Wool Microstructure as a Generic Polyamide**

**Figure 5 Wool Methionine Amino Acids**

Figure 6 depicts wool  $n(C_{34}H_{62}O_{15}N_9S_2)$  protein microstructure with multivariate unknown side chains.

**Figure 6 Wool Protein Depicting all Amino Acids**

### Greenhouse Gas in Wool Polyamide, Methionine versus Protein

Table 7 lists theoretical polymer chemistry versus embodied GHG to 100 years. The range of such wool results include 3 low and 3 median result sets with means  $\pm 10\%$ . A higher value is listed in Table 6.

**Table 7 Modelling Assumptions for GWP embodied Clean Wool Fibre**

Wool Molecular / GHG Modelling Assumptions	Molar mass Shares			GHG CO <sub>2eq</sub> 100/kg			
	CO <sub>2</sub>	CH <sub>4</sub>	S + N	1*CO <sub>2</sub>	27.2*CH <sub>4</sub>	Sum	Means
Polyamide	0.733	0.267	0.000	0.733	7.267	8.00	8.8
Methionine	0.666	0.306	0.028	0.666	8.334	9.00	
Protein O <sub>2</sub> limited	0.652	0.320	0.028	0.652	8.708	9.36	
Protein H <sub>2</sub> limited	0.380	0.592	0.028	0.380	16.112	16.5	18.1
67% Rumen Protein	0.337	0.635	0.028	0.337	17.275	17.6	
67% Rumen Methanotroph	0.244	0.729	0.027	0.244	19.818	20.1	

Table 8 lists wool polymer chemistry modelling assumptions against Global Warming Potential (GWP) results to 100 year horizons of biogenic, land use change, fossil fuel use and the total GHG<sup>16</sup>. These cradle to grave results also show close lower and median result set means  $\pm 10\%$  plus a higher value including minimum N<sub>2</sub>O emissions. Biogenic GWP results are most sensitive to inclusion of embodied N<sub>2</sub>O in the protein modelling. None of these lower, median or high results yet include embodied N<sub>2</sub>O.

**Table 8 Modelling Assumptions for GWP embodied Clean Wool Fibre**

Wool / GWP Model Assumed	Biogenic	LULUC	Fossil Fuels	Total	Mean
Polyamide	-8.3	-1.7	2.8	-7.2	8.0
Methionine	-9.3	-1.7	2.8	-8.2	
Protein O <sub>2</sub> limited	-9.7	-1.7	2.8	-8.6	
Protein H <sub>2</sub> limited	-16	-1.7	2.8	-16	17.3
67% Rumen Protein	-18	-1.7	2.8	-17	
67% Rumen Methanotroph	-20	-1.7	2.8	-19	
67% Rumen Methanotroph + N <sub>2</sub> O	-28	-1.7	2.8	-27	NA

In summary this background data shows fleece GHG most sensitive to polymer and rumen microbial chemistry. More evidence is vital to reveal which best fits a particular herd, rumen, soil or forage type.

Furthermore, more evidence, is vital to show if upper result inclusion of embodied N<sub>2</sub>O fits upland station wool production in marginal land grazing across New Zealand, Australia, South Africa, PR China and USA.

### Background and Primary LCA Data Included and Excluded in this EPD

This EPD declares the lowest embodied GWP wool protein estimate considering no significant land use change since 1925. Pasture drawdown was modelled on CSIRO fodder intake of 33% foraging. It also includes lowest soil drawdown from on-site testing. The 7.7% mass fleece share was reduced for flocks grazing on marginal upland in New Zealand to 5.7% as wool insulation reduces winter heat loss 25% of the year.

## Environmental Impact Terminology

Environmental impacts contributing to risks of social and ecological issues and collapse are tabled below with common names and remedies given for each indicator.

<b>Global warming forcing climate change</b>	Greenhouse gases absorb infra-red radiation. This heat reduces thermal energy differentials, from equator to poles, forcing ocean current and wind circulation to blend and regulate climate. Weakly blended “lumpier” weather has more frequent, extreme heat wave, fire-storm, cyclone, rain-storm, flood and blizzard events. Accumulation of carbon dioxide, natural gas methane, nitrous oxides and volatile organic compounds from burning fossil fuels causes global warming. Forest and wilderness growth absorbing air-borne carbon in biomass can drawdown such accumulation. Urgent renewable energy reliance is vital in time to avoid imminent tipping points and the worsening “ <b>climate emergency</b> ”.
<b>Ozone layer depletion</b>	Stratospheric ozone loss weakens the planet’s solar shield so more shorter wavelength ultraviolet (UVB) light reaching earth damages plants and increases malignant melanoma and skin cancer in humans and animals. Chlorofluorocarbons, hydrochlorofluorocarbons (HCFC), chlorobromomethane, hydrobromofluorocarbons, carbon tetrachloride, methyl chloroform, methyl bromide and halon gas cause ozone layer loss. To repair the “ <b>ozone hole</b> ” reliance on ozone-safe refrigerants, aerosols and solvents is essential to avoid further its depletion and enable accumulation of naturally-formed ozone.
<b>Acidification</b>	Acidification reduces soil and waterway pH, impedes nitrogen fixation vital for plant growth and inhibits natural decomposition. It increases rates and incidence of fish kills, forest loss and deterioration of buildings and materials. Chief synthetic causes of “ <b>acid rain</b> ” are emissions of sulphur and nitrogen oxides, hydrochloric and hydrofluoric acids and ammonia from burning fossil fuels polluting precipitation of rain and snow world-wide.
<b>Eutrophication of terrestrial, freshwater and marine life</b>	Eutrophication from excessively high macronutrient levels added to natural waters promotes excessive plant growth that severely reduces oxygen, water and habitat security for aquatic and terrestrial organisms across related ecosystems. Chief synthetic cause of “ <b>algal blooms</b> ” is nitrogen (N, NO <sub>x</sub> , NH <sub>4</sub> ) and phosphorus (P, PO <sub>4</sub> <sup>3-</sup> ) in rain run-off over-fertilised land catchments.
<b>Photochemical ozone creation</b>	Tropospheric photochemical ozone, called “ <b>summer smog</b> ” near ground level, is created from natural and synthetic compounds in UV sunlight. Low concentration smog damages vegetation and crops. High concentration smog is hazardous to human health. Chief synthetic causes are nitrogen oxides, carbon monoxide and volatile organic compounds (VOC) pollutants. Avoiding reliance on dirtiest coal fuel and volatile chemicals has reduced smog incidence in many areas globally.
<b>Depletion of minerals, metals &amp; water</b>	Abiotic depletion of finite mineral resources increases time, effort and money required to obtain more resources to the point of extinction of naturally viable reserves. This can limit access to available, valuable and scarce elements vital for human-life. The youth movement “ <b>extinction rebellion</b> ” calls on adults to secure climate, reserves and biodiversity for current and future generations.
<b>Depletion of fossil fuel reserves</b>	Abiotic depletion of resources by consuming finite oil, natural gas, coal and yellowcake fossil fuel reserves leaves current and future generations suffering limited available, accessible, plentiful, essential valuable as well as scarce raw material, medicinal, chemical, feedstock and fuel stock. Approaching “ <b>peak oil</b> ” acknowledged fossil fuel reserves are finite and the need for decision-makers to act to avoid market instability, insecurity and or oil and gas wars.

## Environmental Parameters and Methods

Table 9 lists methods and parameters for environmental impact, resource use and waste output. Table 10 lists results for environmental impact, resource use and waste output per functional unit. As there were no flows for module B1, B4, B5, B6, B7 and C3 all their LCA results are zero.

**Table 9 Environmental Parameters, Units and Methods Description**

Parameter	Acronym	Unit	Method Description
<b>Environmental Impact</b>			
Climate Change biogenic	GWPb	kg CO <sub>2eq</sub>	GWP sequestered from air [10]
Climate Change luluc	GWPI	kg CO <sub>2eq</sub>	GWP land use & change [10]
Climate Change fossil	GWPf	kg CO <sub>2eq</sub>	GWP fossil fuels [10]
Climate Change total	GWPT	kg CO <sub>2eq</sub>	Global Warming Potential [10]
Stratospheric Ozone Depletion	ODP	kg CFC <sub>11e</sub>	Stratospheric Ozone Loss [11]
Photochemical Ozone Creation	POCP	kg NVOC	Summer Smog [12]
Acidification Potential	AP	mol H <sup>+</sup> <sub>eq</sub>	Accumulated Exceedance [13]
Eutrophication Freshwater	EPF	kg P <sub>eq</sub>	Excess freshwater nutrients [14]
Eutrophication Marine	EPM	kg N <sub>eq</sub>	Excess marine nutrients [15]
Eutrophication Terrestrial	EPT	mol N <sub>eq</sub>	Excess nutrients to land [16]
Fossil Depletion	ADPF	MJ <sub>ncv</sub>	Abiotic Depletion fossil fuel [17]
Mineral and Metal Depletion	ADPE	kg Sb <sub>eq</sub>	Abiotic Depletion minerals [18]
Water Scarcity Depletion	WDP	m <sup>3</sup> <sub>WDP eq</sub>	Water Deprivation Scarcity [19,20]
<b>Resource Use</b>			
Net Fresh Water	FW	m <sup>3</sup>	Lake, river, well & town water
Secondary Material	SM	kg	Post-consumer recycled Material
Renewable Secondary Fuel	RSF	MJ <sub>ncv</sub>	PCR biomass burnt
Non-renewable Secondary Fuel	NRSF	MJ <sub>ncv</sub>	PCR fossil feedstock & fuel use
Primary Renewable Material Energy	PERM	MJ <sub>ncv</sub>	Biomass feedstock material retained
Primary Renewable Energy	PERE	MJ <sub>ncv</sub>	Renewable energy and biomass fuel
Total Primary Renewable Energy	PERT	MJ <sub>ncv</sub>	Total renewable energy & biomass fuel
Primary Non-renewable Material	PENRM	MJ <sub>ncv</sub>	Fossil feedstock material retained
Primary Non-renewable Energy	PENRE	MJ <sub>ncv</sub>	Fossil fuel burnt
Total Primary Non-renewable Energy	PENRT	MJ <sub>ncv</sub>	Total fossil energy and feedstock use
<b>Waste Output</b>			
Hazardous Waste Disposed	HWD	kg	Reprocessed to contain risks
Non-hazardous Waste Disposed	NHWD	kg	Municipal landfill facility waste
Radioactive Waste Disposed	RWD	kg	Most ex nuclear power stations
Components For Reuse	CRU	kg	Product scrap for reuse as is
Material For Recycling	MFR	kg	Factory scrap to remanufacture
Material For Energy Recovery	MER	kg	Factory scrap use as fuel
Exported Energy Electrical	EEE	MJ <sub>ncv</sub>	Uncommon for building products
Exported Energy Thermal	EET	MJ <sub>ncv</sub>	Uncommon for building products

## Results Module A and B

Table 10 lists Module A and B environmental impact, resource use and waste results per functional unit.

## Interpretation

### Cradle to Gate A1 to A3/functional unit

Embrace wool felt acoustic insulation panel Greenhouse gas (GHG) Global Warming Potential (GWP) kgCO<sub>2e</sub>/kg functional unit results cradle to gate for various assumed wool chemical components. Figure 7 charts component type versus GWP. Here GWP varied directly with assumed and embodied molecules, particularly methyl, methylene and carboxyl groups. The polyamide had least GWP, then methionine and Protein (O<sub>2</sub> ltd) all in close agreement. Better negative GWP was found from group of the

- Hydrogen limited protein,
- 67% methane-rich rumen protein with 33% grass sequestered CO<sub>2e</sub>-rich sugars and
- 67% methane-rich Methanophile rumen protein 33% grass sequestered CO<sub>2e</sub>-rich sugars,

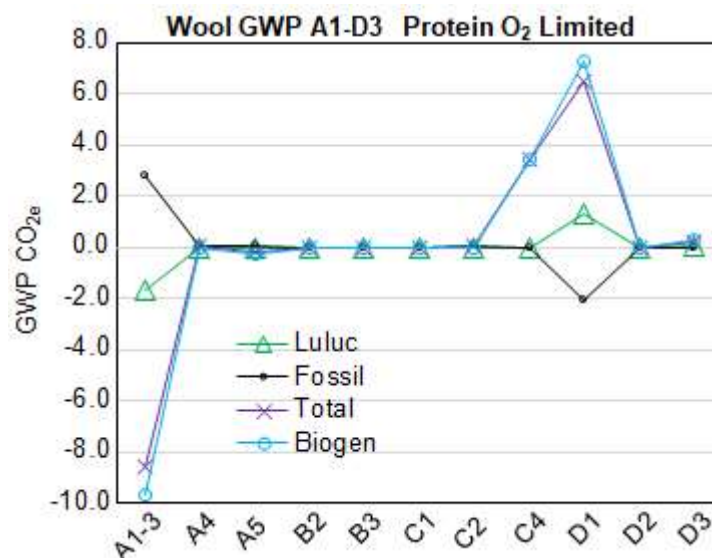

**Figure 7 Feedstock type versus GWP (CO<sub>2e</sub>kg)/kg product.**

### Cradle to Grave A4 to D3 /functional unit

This EPD declares low range results from modelling Oxygen limited protein flows embodied in Embrace wool felt results cradle A1 to D3 fates beyond the system boundary. Figure 8 shows that overall total GWP results are best A1 to A3. They are worse in C2 trucking to landfill and C4 disposal via combustion but worst in reuse avoiding new wool product. Biogenic GWP is best A1 to A3, worse in C2 and C4 but worst in D1. Luluc GWP is best A1 to A3 and worst in D1 reuse. Fossil fuel GWP use is highest from A1 to A3, then lowest in D1 reuse.

**Figure 8 Feedstock type versus GWP (CO<sub>2e</sub>kg)/kg product.**

## Methods and Data

### Life Cycle Assessment Method

<b>LCA Author</b>	The Evah Institute, <a href="https://www.evah.institute">https://www.evah.institute</a>
<b>Study Period</b>	Factory data was collected from 2023 to 2025
<b>LCA Method</b>	ISO 14040 & ISO 14044 Standard Compliant
<b>LCIA method</b>	ReCiPe 2016 Life Cycle Impact Assessment
<b>Scope</b>	Cradle to fate including all supply chain phases and stages depicted in Figure a.
<b>Phases</b>	The LCA covered all known flows in all known stages cradle to end of life fate.
<b>Assumptions</b>	Use is to typical Australian Facility Management Association professional practice.
<b>Scenarios</b>	Use, cleaning, maintenance plus disposal and re-use were scenario-based using Facility Management Association denoted and published typical operations.
<b>Processes</b>	<p>All known processes are included from resource acquisition, water, fuel &amp; energy use, power generation &amp; distribution, freight, refining, intermediates, manufacture, scrap re-use, packing and dispatch, installation, use, maintenance and landfill.</p> <p>All significant waste and emission flows from all supply chain operations used to make, pack and install the product are included.</p>

Evah industry databases cover all known domestic and global scope 1 and 2 operations.

They exclude scope 3 burdens from capital facilities, equipment churn, noise and dehydration as well as incidental activities and employee commuting.

Electricity supply models in active databases are updated annually. As each project is modelled and new data is available the databases are updated.

They are then audited by external Type 1 ecolabel certifiers.

The databases exist in top zones of commercial global modelling and calculating engines.

Quality control methods are applied to ensure:

- Coverage of place in time with all information for each dataset noted, checked and updated;<sup>17</sup>
- Consistency to Evah guidelines for all process technology, transport and energy demand;<sup>18</sup>
- Completeness of modeling based on in-house reports, literature and industry reviews;
- Plausibility in 2 way checks of LCI input and output flows of data checked for validity, plus
- Mathematical correctness of all calculations in mass and energy balance cross checks.

<sup>17</sup> Jones D G (2004) LCI Database for Commercial Building Report 2001-006-B-15 Icon.net, Australia

<sup>18</sup> Evah Tools, Databases and Methodology Queensland, Australia at <http://www.evah.com.au/tools.html>

## Data Sources Representativeness and Quality

### Primary Data

Primary data used for modelling the state of art of each operation includes all known process for:

- Technology sequences
- Energy and water use
- Landfill and effluent, plus
- Reliance on raw and recycled material
- High and reduced process emissions
- Freight and distribution systems.

Electricity mix is site location-based throughout as per the PCR. All applied background databases and software versions are declared. Cut-off criteria complies with EN 15804:2012+A2:2019. Table 9 defines all characterisation factor versions. No primary data set with  $\geq \pm 30\%$  uncertainty is used. No data from EcolInvent was used. Primary data is sourced from client annual reports and publications on corporate locations, logistics, technology use, market share, management systems, standards and commitment to improved environmental performance. Information on operations is also sourced from client:

- Supply chain mills
- Factory site development license applications
- Supplier technical manuals
- Manufacturing specifications
- Manufacturer websites
- Corporate annual reports and
- Industry sector experts

### Background supply chain data

Background data is sourced from

- The International Energy Agency
- IBISWorld
- USGS Minerals
- Franklin Associates
- Boustead 6
- Plastics Europe,
- CML2
- Simapro 9.5
- EcolInvent 3.9 and
- NREL USLCI model databases

Information on operations is also sourced from:

- Library documents
- NPI and web searches
- Review papers
- Building manuals
- Global industry association and
- Government reports on best available technology (BAT).

For benchmarking, comparison and integrity checks inventory data is developed to represent best available technology (BAT) and business as usual (BAU) operations covering industry sector supply and infrastructure in Australia and overseas. Such technology, performance and license conditions were modelled and evaluated across mining, farming, forestry, freight, infrastructure and manufacturing and building industry sectors since 1995.

As most sources do not provide estimates of accuracy, a pedigree matrix of uncertainty estimates to 95% confidence levels of Geometric Standard Deviation squared ( $\sigma_g$ ) is used to define previously stated data quality on Page 7 in Table a.<sup>19</sup>

<sup>19</sup> Evah Institute data quality control system accords with UNEP SETAC Global LCI Database Quality 2010 Guidelines

## Supply Chain Modelling Assumptions

Australian building sector rules and Evah assumptions applied are tabled below

### Scope Boundaries Assumptions and Metadata

Quality/Domain	National including Import and Export
<b>Process Model</b>	It is typical currently most common industrial or best (BAT) technology practice.
<b>Resource flows</b>	LCI uses regional data for resource mapping, fuels, energy, electricity & logistics.
<b>Temporal</b>	Project data collated over prior 4 years but represents the last year averages.
<b>Geography</b>	Jurisdiction is for declared client, site, regional, national, Pacific Rim then Europe.
<b>Representation</b>	Representing the declared client', suppliers and energy providers to each cradle.
<b>Consistency</b>	All known operations are modelled according to operations with closest proximity.
<b>Technology</b>	Industry supply chains modelled are typical recent Pacific Rim practice.
<b>Functional Unit</b>	Applies 20 or 60 year typical service life period, use, cleaning & disposal/kg or m <sup>2</sup> .
<b>System Control</b>	
<b>Primary Sources</b>	Client' supplier mills, publications, websites, specifications and manuals are used.
<b>Other Sources</b>	Recent IEA, GGT, Simapro, IBIS, Ecolnvent sources used and cited in LCA reports.
<b>Data mix</b>	Power grid and renewable shares are updated according to latest IEA reports.
<b>Operational</b>	Company data is used for process performance, product share, waste & emissions.
<b>Logistics</b>	Local data is used for power, fuel mix, water supply, logistics share & capacity.
<b>New Data Entry</b>	New data is entered by current researchers at Malaika LCT, Evah and GGTI.
<b>Data Generator</b>	All current cited manufacturers, Evah, GGTI, IBIS & others & in LCA reports.
<b>Data Publisher</b>	Publishers include the Evah Institute, GGTI and designated clients only.
<b>Contributors</b>	All professional and personal contributors cited in Evah & GGTI records.
<b>Data Flow &amp; Mix</b>	
<b>System Boundary</b>	All known resources & emissions modelled from Earth cradle to end of life fate.
<b>System flows</b>	All known flows modelled from/to air, land, water & community sources & sinks.
<b>Capital inclusions</b>	Natural stocks $\Delta$ , industry stockpiles $\Delta$ , capital wear $\Delta$ , system losses & use.
<b>Arid Practice</b>	Dry technology adopted; Water use is factored by 0.1 as for e.g. mining.
<b>Transportation</b>	Distance >20% than EU; >20% fuel efficient larger vehicles, load & distance.
<b>Industrial</b>	Company or industry sector data for manufacturing & minerals involved.
<b>Mining</b>	All resource extraction is based on Australian or Pacific Rim technology.
<b>Imported fuel</b>	Fuel mix is from nearest UAE, SE Asian, Canadian or New Zealand sources.
<b>Finishes</b>	Processing inputs with finishing burdens are factored in or that is denoted.
<b>Validation</b>	
<b>Accuracy</b>	10 <sup>th</sup> generation study is $\pm 5$ to 15% uncertain due to some background data.
<b>Completeness</b>	All significant operations are tracked and documented from cradle to grave.
<b>Precision</b>	Tracking of >90% flows apply a 90:10 rule sequentially to 99.9% & beyond.
<b>Allocation</b>	All allocated to co products on reaction stoichiometry by energy or mass fraction.
<b>Burdens</b>	Includes all known resource use from & emissions to community air, land & water.
<b>Plausibility</b>	Results are checked and benchmarked against BAT, BAU & worst practice.
<b>Sensitivity</b>	Calculated U is reported & compared to Bath U RICE & Ecolnvent libraries.
<b>Validity Checks</b>	Checked versus Plastics Europe, Bath U RICE & or Industry LCA Literature.

## Part 6 Nature Positive Assessment

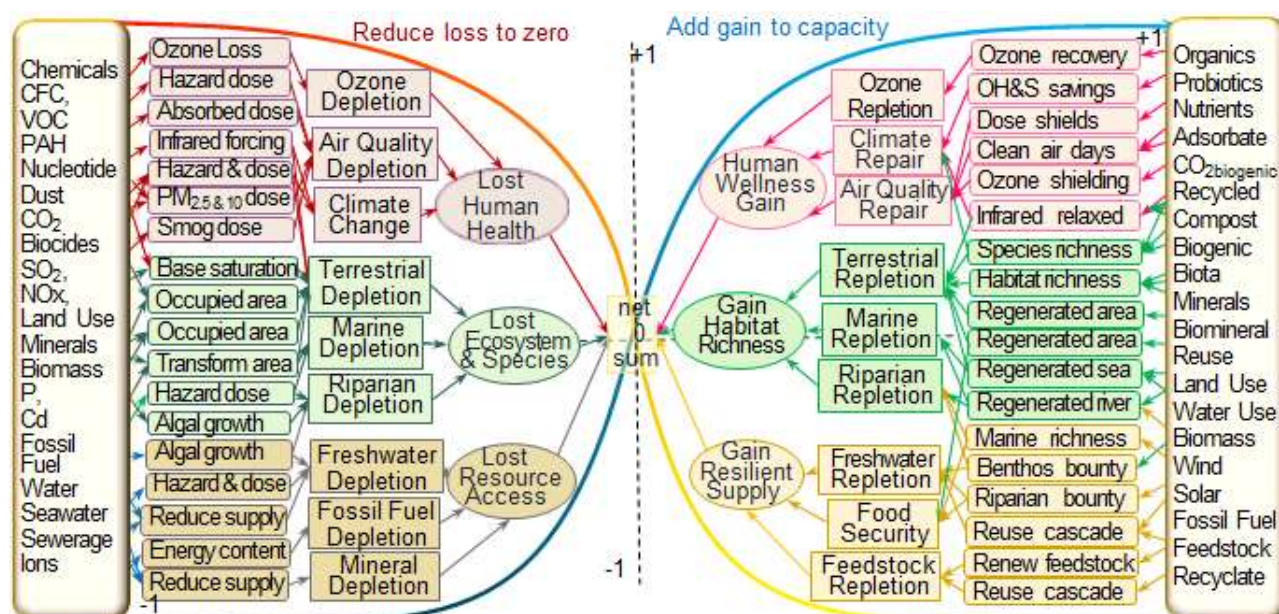

The United Nations (UN) Nature Positive (N+) Program provides global impetus for EPDs to consider gain versus loss in climate and biodiversity security [27, 28, 29]. But the reach of most LCIA methods such as the leading ReCiPe is modelling damage and depletion from maxima to zero as depicted on the left-hand side of in Figure 7 [29, 30, 31, 32].

Conventional LCIA models environmental damages to e.g. climate and loss of human health, ecosystem quality and resource supply [32, 33].

The reach of N+, however extends scientific sightlines beyond zero damage to quantify benefits, gains and regeneration [33, 34], 35. Other information in N+ EPDs sight beyond damage to define additional information on net-positive benefit outcomes including many gains depicted on the right-hand side of Figure a [30 to 32].

Figure 4 depicts the ReCiPe LCIA method modelling damage, depletion and loss versus the Evah Life Cycle Benefit indicators (LCBA) method modelling benefit, repletion and gain to assess net-loss and net-gain of

- climate security,
- human wellness and
- resource supply viability [33 to 36].
- 

**Figure 4 ReCiPe LCIA of damaging loss versus Evah LCBA of beneficial gain**

Such extended assessment is applicable to empower communication and reduce barriers for regenerative and nature-positive initiatives. LCA of benefits offers community, government and business a new environmental science tool with examples of methods to measure gains in accelerating restoration and climate security.

Using LCBA in conjunction with conventional LCIA modelling of damages allows LCA modelling of damages to and beyond of zero climate, health, ecosystems and supply losses to beneficial gains in e.g. climate, wellness, biodiversity and supply security.

Reaching to quantify and show positive gains well beyond the negative and zero loss outcomes, LCBA enables a truer market assessment. The capacity to report positive metrics can also reduce prevalent greenwashing and reliance on bad news that has disempowered scientifically valid communications and efforts to engage community action.

## Environmental Benefit Terminology

Key environmental benefits contributing to ecological regeneration of climate and biodiversity security are tabled below with common names and responses for each indicator.

<b>Climate Security</b>	Reliance on renewable energy is vital to restore thermal energy differentials, from equator to poles. Differential forcing of ocean current and wind circulation blends and regulate climate to reduce extreme weather events. Forest, wilderness and algal growth can drawdown such gasses. Carbon banked in standing forests, detritus, roots and soils brakes climate change. Greenhouse gas drawdown and sequestration in product biomass is vital for <b>“Climate security”</b> .
<b>Water Security</b>	<b>“Water security”</b> arises from conservation and recycling as well as reliance on renewable and reclaimed biomass to avoid climate-change-induced drought. Hectares of intensive forest and plantings stabilise rain catchment and ground water table levels. Ground mulches retain soil hydration and reduce water stress.
<b>Ozone Repletion</b>	Repairing the planet’s stratospheric ozone solar shield protects plants, humans and animals allowing them to be <b>sun-safe</b> for longer in the outdoors. Ground level oxygenation via growing plants and algae is a chief way to enable accumulation higher level naturally-formed Ozone. Restoring the ozone layer also depends on use of ozone-safe refrigerants, aerosols and solvents
<b>Buffered air, land and waters</b>	Acid rain-free air-sheds are safer for natural terrestrial, aquatic and urban communities. Buffered air-pH supports healthy soil and waterways, nitrogen fixation vital for plant growth and natural decomposition. Safe pH supports health of fisheries, forests, buildings and materials. Chief ways to enhance <b>“natural-rain”</b> are reliance on renewable fuels and power supply.
<b>Oxygenated terrestrial and aquatic life</b>	Nutrient and oxygen availability balances in natural waters promotes healthy plant growth, water and habitat security for aquatic and terrestrial organisms across related ecosystems. Chief ways to enhance healthy waterways is to tightly control slow-release fertilisers avoiding synthetic nutrients in rain run-off land catchments.
<b>Sweet-air</b>	Smog-free air in summer near ground level when most people live and breathe outside is generated by plants and avoiding or filtering pollutants. <b>Sweet-air</b> enables healthy vegetation, crops and humans to thrive. Chief ways to enhance sweet-air are reliance on low-emission renewable energy and non-volatile chemicals.
<b>Resource Repletion</b>	The extinction rebellion youth movement calls on governance to secure climate, material reserves and biodiversity for current and future generations. Chief ways to ensure resource repletion include investing in sustainably managed <b>“circularity”</b> , recycling, renewables and reclaimed biomass. This retains accessible, plentiful, essential valuable raw material, medicinal, chemical, feedstock and fuel stock.
<b>Biodiversity Security</b>	Extensive bushland, biodynamic and organic agriculture plus standing forests offer natural land use ranges and corridors for wildlife, herds and flora <b>“biodiversity”</b> : <ul style="list-style-type: none"> <li>• habitat bird, bee, pollinator, avian, worm biome, shelter, forage and grazing</li> <li>• leaf &amp; litter forage enhance soil condition, mulch, nutrition and retention,</li> <li>• soil microbiota, detritus-feeders and biotic refuges reduce temperature stress</li> <li>• CO<sub>2e</sub> sequestered in natural habitat, biomass &amp; soil braking climate change.</li> </ul>
<b>Ecological Wellness</b>	Human ecological health benefits flow from reliance on renewable and reclaimed biomass instead of fossil fuel. Chief ways to enhance <b>“wellness”</b> include avoiding particulates and pollution, smog, volatile organics and carcinogens. Climate and ozone security and safer air-sheds ensue for natural terrestrial, aquatic and urban communities.

### Life Cycle Benefit Assessment Reference Framework

This section summarises the LCBA framework of measures metrics and indicators. Local and global human wellness, habitat regeneration and supply resilience and circularity outcomes are framed against United Nations Sustainable development goals (UN SDG)s [16 to 32]. LCBA reaches beyond zero loss to show gains in climate, wellness, biodiversity and supply security.

#### LCA framework of LCBA indicators

Benefit Layer	Exposure & Jurisdiction	Unit/annu	Local	Global	UN	Circularity
<b>Healthy Able Life Years (HALY)</b>		<b>HALY/capita</b>		<b>benchmar</b>	<b>SD</b>	<b>% Capacity</b>
Local Shelter	Household shelter	m <sup>2</sup> GFA	Housed	UN <sub>eq</sub>		Housing
Fresh Food	Affordably nourished	kJ UN <sub>eq</sub>	Well Fed	UN <sub>eq</sub>		Nutrition
Fresh Air	Oxygen indoors	kg O <sub>2</sub>	Oxygen	O <sub>2</sub> C1750		Oxygenation
Clean Air	PM <sub>2.5</sub> dust-free	µg PM2.5	Clean Air	PM C1750		Decongestion
Sweet Air	VOC free indoors	µg VOC	Safe Air	VOC C1750		Inhalation
Sun Safety	Ozone layer repair	kg O <sub>2</sub> outdoors	Sun Safe	O <sub>3</sub> C1750		Ozonating
Time in Nature	100 days recreation pppa	R&R Ha	Relaxed	Ha C1750		Free-time
Medical Access	Paramedic Care	hours aid	Paramedic	hours to aid		Medic-access
Work Dignity	>30hrs paid work/week	\$ <sub>eq</sub> /hour	Working	km UN <sub>eq</sub>		Secure-work
Fresh Water	Potable rain hydrated	m <sup>3</sup>	Rainwater	rain C1750		Potability
<b>Supply Energy &amp; Resource Viability</b>		<b>SERV/capita</b>		<b>metric</b>		<b>% Capacity</b>
Viable Water	Refill local reservoirs	m <sup>3</sup> freshwater	Watered	Rain C1750		Freshwater
Viable Air	Photosynthetic Cities	kg O <sub>2e100</sub>	Breathable	O <sub>2</sub> C1750		Oxygenation
Viable C-bank	Resink Carbon in product	kg CO <sub>2e100</sub>	C banks	CO <sub>2e100</sub>		Bank-carbon
Viable Energy	Reliance on renewable	kg renewed	Renewing	oil <sub>eq</sub>		Renewability
Viable Food	Reliance on local food	kJ km	Fed Local	UN <sub>eq</sub>		Food autonomy
Viable Supply	Refuel local reserves	kg feedstock	Fuel stock	oil <sub>eq</sub>		Autonomy
Viable Mineral	Recycle scarce material	MJ elemental	Abundancy	oil <sub>eq</sub>		Mineral security

Avian Stock	Species rich refugia	t Avistock	Richness	Birds		Abundance
Pollinator stock	Species richness & range	t Beestock	Species	Bees		Biodiversity
Nature Reserve	Scarce reserves restocked	t Reserve	Resources	Capacity		Reserves

## Otari Station

The sheep wool is from Otari Station's 10,000 acres of land ranging from fertile and productive river flats rolling to steep hill country peaking at 700m. It hosts sheep, cattle, forests, original vegetation reserves and bee hives producing manuka honey. Yearly it hosts the mountain bike and trail run to raise funds for Hunterville School<sup>20</sup>. Otairi Station also hosted the main events at the Otairi-Pukeroa dog trials in 2025.

Otairi follows the Managapapa River to its confluence with the Turakina River, offering majestic views of Mount Ruapehu Wangau River depicted inset<sup>21</sup> Much flora in the river basin is broadleaf and podocarp forest with understories of crown and other ferns and a variety of shrubs. The river and its tributaries are home to invertebrates such as mayflies, stoneflies and caddis flies. Blue duck populations are found at the junction of the Whanganui River and Mangatepopo and Okupata streams. The Nankeen night heron roosts along the Whanganui River and breeds in New Zealand only here.

Native fish species in the river include Cran's bully, upland bully, climbing galaxias, longfin and short-finned eels, pouched lamprey, shortjaw kokopu, torrent fish, New Zealand smelt and black flounder. Other native aquatic species include koura and declining numbers of New Zealand freshwater mussels.

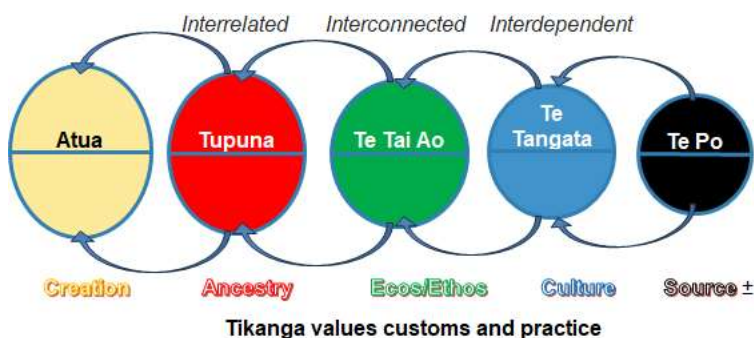

## Values of the Ngati Manawa,

Otairi Station has 2324 hectares subject to Māori ahikaroa hearth-land rights under the Ngati Manawa: Tawhiuau Mountain and Rangitāiki river guardians. Their principles to avoid harm or reduce value include:

- protection of wahi tapu (lands), indigenous flora and fauna and its wider environment;
- recognition of its mana (life force), kaitiakitanga (guardianship) and tikanga (customs);
- respect for tikanga historical, social, cultural and maunga (mountain's) spiritual significance;
- encouraging respect for their association with their sacred maunga,
- accurate portrayal of their association with Mount Tawhiuau and recognising their
- relationship with wahi tapu (spiritual places) and their wahi whakahirahira (vital significance)

Figure 5 depicts the Ngati Manawa world view, foundation and interaction of people and environment.

Te Po the source of creation balances positive and negative elements of interdependent realms to maintain dependant ecology.

**Figure 5 Ngati Manawa World View**

Te Tangata, their organisation, has an iwi, of interdependent kinship groups with separate responsibility.

Te Tai Ao, the environment created by separating sky and earth links spiritual and physical realms. Interdependent ethos, ecosystems and practises include place to belong, hearth-land rights and self-determination. Survival depends living and working in harmony with Te Tai Ao.

Tupuna or ancestors imparted knowledge of and environmental responsibilities to Atua. Their guardians' knowledge of how and what we down as passed down through song, story-telling and conversation.

Atua are Māori gods and spirits controlling and creating environments. Ngāti Manawa are guardians of the Tawhiuau Mountain and Rangitāiki river. From Atua, they are responsible to maintain and care for all inhabitants and components. Their methods and protocols are embodied in their being, thinking and doing, an inherent part of their self-determination and ancestry. All this is monitored and protected by their elders' advice and guidance.

<sup>21</sup> [https://en.wikipedia.org/wiki/Whanganui\\_River](https://en.wikipedia.org/wiki/Whanganui_River)

## Contemporary Natural and Social Disasters

In the data period that this LCA covers, many worst-ever-recorded and widespread natural and social disasters also disrupted supply chains locally nationally and globally.

After recent widespread worst-ever recorded natural and social disasters, few benefits were expected for the geographical area where most product components were sourced.

In the last decade many reports describe historic social and natural disasters and their impacts on natural land, bush, urban, air and aquatic and marine environments [32].

## Regenerative imperitives

Despite compelling positive results shown in the following section they also illustrate that nature positive outcomes are imperitives for regeneration to combat recent natural disasters attributable to anthropogenic climate change [15].

So after a decade of increasingly widespread worst-ever recorded local, national and global, natural and social disasters disrupted security no benefits were expected from:

- urban stock of flora in parks, walls and greenspace for urban life.
- aquatic stock of frogs in rivers, lakes and dams, aquatic life and
- marine and fish stock in nearby estuaries, bays and oceans for marine life.
- 

## Life Cycle Benefit Assessment

Some materials and practices inherently promote wellness and like medicine others inherently destroy illness. Positive and net-positive gains and benefits can offset damages and loss.

Benefits from less and avoided impacts and gains arising from properties inherent within a component or utility can also be additive.

The ultimate source of metabolic energy for all biological systems, photosynthesis in plant and algal biomass generates oxygen while drawing down carbon dioxide and water from air that enacts:

- supply of feedstock and food to grow living communities of biomes, wildlife, livestock and people
- energy delivery for ecosystem growth of viable genetic, habitat and species biodiversity ranges
- braking on greenhouse gas forces accelerating anthropogenic climate change as well as
- oxygen release that buffers against anthropogenic depletion of stratospheric ozone layer.

Together these all increase wellness. Positive benefit, gain and circularity results for each damage outcome range from levels being:

- improved that avoids 1 to 99% loss.
- net-zero gain that avoids 100% loss.
- net-benefit that regains  $\geq 100\%$  loss.
- regenerative that regains  $\geq 200\%$  loss.

In this declaration the

- product supply chain and reports confirm a range of inherently positive outcomes /kg.
- functional unit is a kilogram of the product used over 20 years and reuse beyond cradle to grave.

The results in the next sections illustrate if, how and why nature positive wellness, ecosystem and supply benefits arise from reliance on renewable energy and circularity of all types of fossil and biomass feedstock resources.

### Nature Positive LCBA, UNSDG and Circularity Results

The sheep wool product LCBA, land use and % circularity results across the Nature Positive LCBA framework that covers UN SDGs are tabled below. Some 75% are LCBA results, 25% with asterisk are land use area results beyond the system boundary. Overall 11 show improvements, 1 net-zero gain, 3 net-benefits and 10 regenerative outcomes. Of 32 results, 14 exceed full circularity and 7 < 20% circular.

#### Summary of LCBA results /kg Functional Unit

Benefit Layer	Exposure & Jurisdiction	Unit	Circularity	SDG
Healthy Able Life Years (HALY)		HALY/kg	% Capacity	Icon
Local Shelter	Household shelter	m <sup>2</sup> GFA	100% Ruminant Housing	1 
Fresh Food	Affordably nourished	kJ	413% Nutrition	2

<sup>22</sup> Relic ancient biodiversity refuge on farm site

The results in this sections explain all the benefits from the previous table listing Nature Positive LCBA, UNSDG and Circularity Results. All such results are shown in detail in the following pages.

Healthy Able Life Years (HALY) % capacity includes:

- 0.3% R&R recreation time in nature at hill climb bike races and dog trials.
- 97% fresh potable rainwater hydrated and potability reliant on town and rain water
- 100% local shelter for shepherds, sheep and sheep dogs on marginal uplands
- 113% clean air decongested being PM<sub>2.5</sub> dust-free
- 142% sweet air with less cancer risk being VOC-free outdoors
- 236% fresh air via oxygenation to indoors
- 336% sun safety from oxygen from photosynthesis for biosphere refill and ozone layer repair
- 413% fresh affordable nutrition for sheep and dogs not displacing arable cropping land

Supply energy & resource viability (SERV) capacity includes:

- 0.4% mineral security from washery reclaimed potassium
- 65% autonomy viable supply refuel local reserves
- 67% shelter refuges in disasters
- 125% reliance on renewable energy
- 236% oxygenation air from photosynthesis for cities
- 325% carbon bank via resinking carbon in product
- 370% feedstock recyclability of material and scrap
- 370% disaster recoverability via sustenance from fodder reserves plus
- 413% local food autonomy reliance for sheep grazing marginal hill country.

Positive ecosystem reformation (PERF) capacity includes:

- 0.02% carbon banking in marginal land soil across hill country
- 0.2% aquatic stock with aquatic species rich range
- 6% freshwater refill of local reservoirs
- 20% linked corridor & refuge range with wildlife habitat
- 20% wildlife stock and species rich terrestrial refugia
- 50% arial stock abundance with species rich refugia
- 50% pollinator stock biodiversity with species rich range
- 413% climate safety braking climate force and carbon drawdown by plants and algae.

The next sections define cradle to cradle outcomes results under sub headings

- Unsustainable Losses showing no effect
- Net-zero avoiding loss or slightly improved gain
- Improved avoiding all loss.
- Nature Positive net-benefit compensating for more than the loss.
- Regenerative Outcomes compensation for all loss plus replacing it.

### Unsustainable Losses Cradle to Cradle

Table 6a lists supply parameters and unaffected result showing no real gain or benefit.

**Table 6a Unchanged Sheep wool 20year Outcomes/Functional Unit**

Damage measure	Result	Unit	Damage measure	Result	Unit
<b>Induced Climate Change</b>					
Fossil fuel emissions	3.03	kg CO <sub>2e</sub> 100 yr			
<b>Human Health Depletion</b>					
Ionizing Radiation	2.7E-17	kBq U <sub>235e</sub>	Carcinogens	5.0E-09	CTUe
Stratos Ozone Loss	3.6E-09	kg CFC- <sub>11e</sub>	Ecotox Human Health	2.0E-07	DALY

Total Resource Loss	3.0E-04	MJ <sub>surplus</sub>	2ry Renewable Fuel	2.6E-02	MJ <sub>ncv</sub>
Fossil Fuel Depletion	1.76	MJ <sub>surplus</sub>	2ry Fossil Fuel	7.6E-02	MJ <sub>ncv</sub>
Primary Fossil Energy	23	MJ <sub>ncv</sub>	1ry Fossil Feedstock	6.8	MJ <sub>ncv</sub>
			1ry Total Fossil Energy	30	MJ <sub>ncv</sub>

### Near Net Zero Gain Outcomes Cradle to Cradle

This section describes near net zero slightly improved wellness, ecosystem and supply outcomes from including flows that form embodied protein versus ignoring them in durable products.

Table 6b lists slightly better wellness with 7% less ecotoxicity and from cleaner air outdoors meaning inhaling of 8% less ethylene equivalent photochemical summer smog. It also lists near slightly better supply with 2% more energy reuse and 4% less mineral and metal loss.

**Table 6b Near Net Zero Wellness Outcomes/Functional Unit**

Damage	Unit	Result	Δ	Damage	Unit	Result	Δ
<b>Wellness Outcomes</b>							
Ecotox H Health	HALY	1.8E-07	107%	Summer Smog	kg C <sub>2</sub> H <sub>2</sub>	2.5E-03	108%
<b>Supply Outcomes</b>							
Energy for Reuse	MJ	35	102%	Mineral & Metal	kg S <sub>eq</sub>	5.2E-04	104%

### Improved Outcomes Cradle to Cradle

This section describes reducing then replacing significantly more than 100% of loss to show improved wellness, ecosystem and supply outcomes from including flows that form embodied protein.

Table 6c lists improved wellness security from lower premature death and disability lost from

- 113% fewer parts per million (ppm) of ultra fine (2.5 μm to <10 μm) particulates in air
- 142% less cancer toxicity mostly from inhaling 142% less respirable synthetic organic chemicals in cleaner outdoor air.
- 190% less non-cancer toxicity mostly from synthetic inorganic chemicals

It also lists contributions to improved supply security from

- 12% more total energy embodied potentially available for reuse and recycling at end of life
- 21% more total primary renewable energy & 25% total primary renewable feedstock counted
- 96% less general waste to landfill from reuse and recycling at end of life

Furthermore it shows net-gains in ecosystem security and 179% more natural and marginal land use without arable land use for crops, natural land use changed for mining or hazardous landfill operations.

**Table 6c Benefit Outcomes/Functional Unit**

Table 66 Benefit Outcomes - functional unit							
Measures	Unit	Result	Δ	Measures	Unit	Result	Δ
Wellness Improvements							
Particulates 2.5 <sub>ppm</sub>	DALY	1.4E-10	113%	Cancer toxicity ex respirable organics	CTUh	5.6E-09	142%
Non-cancer toxicity	CTUh	9.2E-08	190%				
Supply Improvements							
Total Embodied Energy	MJ <sub>ncv</sub>	82	112%	Feedstock Renewal	MJ	45	125%
Total 1ry Energy Renewal	MJ <sub>ncv</sub>	53	121%	General Waste	kg	0.05	196%
Ecosystem Improvements							
GWP Land use & change	kg CO <sub>2e</sub>	-1.51	112%	Natural land use	points	0.19	179%

### Nature Positive Outcomes Cradle to Cradle

Beyond replacing 100% of loss achieves zero net gain while avoiding over 200% loss achieves nature positive outcomes as described in this section. Table 6d shows wellness security net-gains including from avoided human death and disability from 200% fewer ultra fine (2.5 µm to <10 µm) particulates and 200% less lost human health life years. It also lists ecosystem net-gains from 200% less disappeared ecosystem fraction and 200% less damage and loss overall in EcoIndicator 99 Points.

**Table 6d. Net Gains/kg Functional Unit**

Measures	Unit	Result	Δ	Measures	Unit	Result	Δ
<b>Wellness Benefits</b>							
Human Health EI99	DALY	0	200%	Respirable Inorganics EI99	DALY	0	200%
<b>Ecosystem Benefit</b>							
Ecosystem Quality EI99	PDFm <sup>2</sup> /yr	0.00	200%	EcoIndicator 99	points	0.00	200%

### Regenerative Outcomes Cradle to Cradle

This section describes gains that account for all loss replacement, and more than doubling that amount to redeem ecosystem and climate pre-industrial capacity and regenerate wellness and supply security. Table 6e lists amounts regenerative climate outcomes /functional unit. Regenerative climate outcomes arise from avoiding 325% more global warming via:

- biogenic drawdown via photosynthesis by leaf, algae, roots and soil into durable biomass
- drawdown via chemosynthesis by rumen microbes into protein to grow wool fibre (97% protein)
- as well as carbon banks in soil and product biomass over the longer 100 year term.
- Regenerative wellness benefits arise from net- gains in 325% more photosynthetically produced oxygen for all humans as well as livestock and wildlife and indeed all living things to breathe. Factoring in embodied protein accounts for growing ecosystem regeneration benefits from:
  - upland marginal land security from retained biota, seed, fibre and soil biomass with grazing,
  - leaf, algae photosynthetic sequestration in biomass for drawdown into fodder for herds and
  - rumen and soil aerobic and anaerobic microbiota chemosynthetic drawdown into wool biomass

Embrace wool insulation product accrues regenerative ecosystem benefits including:

- greater biodiversity this decade from 413% more biogenic CO<sub>2</sub> eq 20 yrs drawdown from the air
- pH balance from 949% less acidification of air land and waters in the longer term.

Ecosystem Quality gains arise from 949% less acidification to air land and water. Supply regeneration includes 370% more matter & energy circularity from reliance on total primary renewable energy, primary biomass and material for energy recovery.

**Table 6e Regeneration/kg Functional Unit**

Measures	Unit	Result	Δ	PEF%
<b>Climate Regeneration</b>				
Far Term Climate Braking	kg CO <sub>2</sub> eq 100 yrs	-5.88	325%	8.07
<b>Wellness Regeneration</b>				
Oxygenated Global Airshed	kg O <sub>2</sub> eq 100 yrs	-4.28	236%	8.07
<b>Ecosystem Regeneration</b>				
Biodiversity Biogenic Drawdown	kg CO <sub>2</sub> eq 20 yrs	-7.20	413%	10.26
Acidification pH Balance	mol H <sup>+</sup> eq.	6.8E-02	949%	23.54
<b>Supply Regeneration</b>				
Circularity of matter & energy	MJ share	63	370%	9.18

### Qualitative Summary across LCBA framework indicators

Many results not quantified for this study can instead for quantified under different carbon offset, forestry, biodiversity or water or soil conservation schemas. Additional outcomes listed in this section cover completeness, gaps or factors beyond the LCA system boundary that could be counted in future EPDs.

#### Healthy Able Life Years (HALY) Inset and Set Apart Qualities

<b>Local Shelter</b>	Forests, trees and scrub offer shelter across Otairi station as previously noted Avian, insect and sub grade soil biota shelter across Otairi station
<b>Fresh Food</b>	67% of agricultural land can grow ruminant milk and meat but not plant crops Floral feedstock for birds and bees is most evident across Otairi grazing fields Sheep manure building stronger wetter, deeper soils and bugs.
<b>Fresh Air</b>	Plants & Algae ensure clean air across the hill country
<b>Time in Nature</b>	Local town, farm and school community recreation events
<b>Work Dignity</b>	Agricultural produce industry employs a third of all workers worldwide Forested land is inset and some set apart for timber industry workings Bee hives set apart employ apiarists as well and health industry workers
<b>Medical Access</b>	Bee hives in separate Manuka fields and foraging in pasture making honey Wool grease coproducts are used in pharmaceuticals and healthcare
<b>Fresh Water</b>	Potable water rain catchment across pasture and forest not counted in LCI

#### Supply Energy & Resource Viability (SERV) Inset and Set Apart Qualities

<b>Viable Water</b>	Refill local reservoirs from pastoral rain catchment not counted in LCI
<b>Viable Air</b>	Photosynthetic oxygen buffers clean air supply blown to cities near and far
<b>Viable C-bank</b>	Wool fleece weather-calming force is 8 to 25 times bigger than its weight.
<b>Viable Energy</b>	Wool growth is on renewable photosynthetic and chemosynthetic energy
<b>Viable Food</b>	Sheep food is reliant on forage and rumen feedstock across marginal land
<b>Viable Supply</b>	Sheep flock supplier is from across marginal land unfit for plant crops
<b>Viable Mineral</b>	HawkesBay WoolWorks Washery extracts fleece potassium for fertiliser
<b>Viable Feedstock</b>	HawkesBay WoolWorks Washery extracts fleece Suint for fertiliser HawkesBay WoolWorks Washery extracts grease for health care products
<b>Viable Disaster</b>	HawkesBay WoolWorks was been rebuilt with kit above foreseen flood levels
<b>Viable Shelter</b>	Otairi Station offers disaster-refuge for many avairian and freshwater species

#### Positive Ecosystem ReFormation (PERF) Inset and Set Apart Qualities

<b>Natural Access</b>	Forested valleys and ridged corridors connecting natural habitats.
<b>Urban Bounty</b>	Wool insulation in buildings can lock-up bad weather forces for 100 years
<b>Soil Carbon</b>	Carbon is banked across Otairi soil bar in few rock, road, track and roof areas.
<b>Climate Brakes</b>	Wool blankets, doonas and carpet brakes bad weather force for 20 years
<b>Plants &amp; Algae</b>	Carbon drawdown across Otairi station scrub, grass & woodland as previously noted
<b>Aquatic Stock</b>	Otairi Station rivers are stocked with freshwater species as previously noted
<b>Wildlife Habitat</b>	Forested valleys and ridges connect natural habitat, refugia and extended range
<b>Terrestrial</b>	Rich flora & fauna range Wildlife Habitat original set apart for heritage & study
<b>Avian Stock</b>	Species rich range refugia for many bird, insect species across Otairi station
<b>Pollinator stock</b>	Species richness & range pollinator stock is most evident across Otairi grazing fields
<b>Nature Reserve</b>	Scarce reserves have been retained and restocked for heritage & study

### Interpretation of LCBA

This section interprets the Life Cycle benefit results ranging from improvement, net-gain to regenerative results /kg functional unit cradle to cradle

Unlike linear primary and fossil fuelled operations, inherent benefits arise from reliance on renewable, recycled, reused and or recyclable component circularity in supply.

Figures 6,7 and 8 chart net gain, nature positive and regenerative ecosystem, wellness and supply security.

Together these Embrace product benefits offset 80% of the ecofootprint per capita global citizen/kg product use for 20 years.

Wellness offset 17 PEF points from:

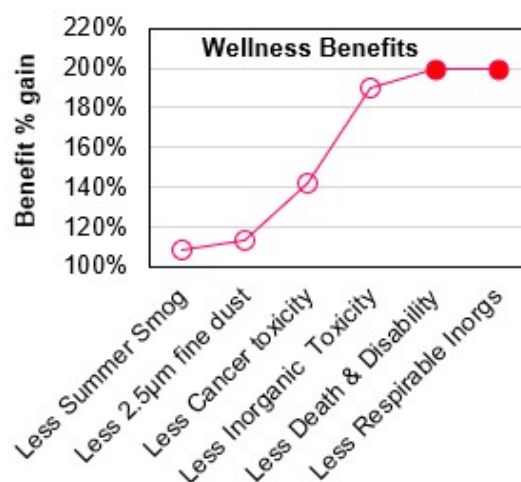

- 107% less human ecotoxicity
- 108% less photochemical smog
- 113% less 2.5µm particulates
- 142% less respirable organics
- 142% less cancer toxicity
- 190% less non-cancer toxicity
- 200% less respirable inorganics
- 200% less human health loss

Ecosystem offset 46 PEF points from:

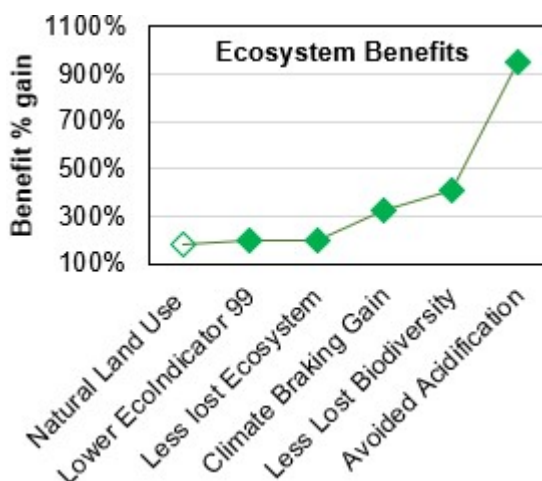

- 200% avoided loss of Ecosystem Quality EI99
- 200% avoided loss in EcoIndicator 99
- 949% avoided acidification loss of pH balance
- 413% avoided biodiversity loss
- 179% avoided natural land use change
- 325% stronger climate brake force to 100 years
- 

Supply offset 17 PEF points from:

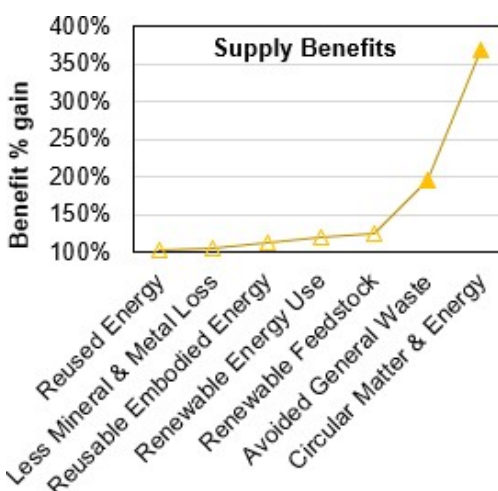

- 104% avoided mineral and metal depletion
- 196% avoided general waste
- 102% more energy reuse
- 112% more total embodied energy
- 121% more total 1ry renewable energy
- 125% more feedstock renewal
- 370% more matter and energy circularity

**Figure 5 Wellness Security/kg F unit**
